Evening Talk: Novel Tests of QCD at FAIR

Thursday, 16 October 2014 20:30 (1 hour)

The antiproton and heavy ion facilities at FAIR will provide ideal platforms for testing many novel aspects of Quantum Chromodynamics, the fundamental theory of hadron and nuclear physics. These include:

- (a) new probes of hadron and nuclear structure;
 - (b) the breakdown of factorization theorems due to QCD lensing effects;
 - (c) the nonuniversality of nuclear anti-shadowing;
 - (d) the hidden-color degrees of freedom of nuclei;
 - (e) the physics of charm and bottom production at high momentum fraction;
 - (f) the production and decay of exotic heavy-quark hadrons;
 - (g) higher-twist reactions such as digluon-initiated quarkonium production;
- and
- (h) color transparency and the dynamics of hard exclusive and diffractive reactions.

I will also discuss recent advances in understanding color confinement and the fundamental light-front wavefunctions of hadrons in nonperturbative QCD.
