## Dilepton production in pion-nucleon and pion-nucleus reactions (CBM)

*Thursday, 16 October 2014 14:40 (30 minutes)*

We calculate electron-positron pair production in pion-nucleon and pion-nucleus collisions. Parameters of the model are fitted to pion photoproduction data. We use these cross sections in a transport model to study  $\pi$ -nucleus reactions. We investigate especially what is the effect of the interference between the  $\rho$  and  $\omega$  mesons on the dilepton spectra. We suggest a way how experimentally the decoherence can be measured in the medium, comparing  $\pi$ -N,  $\pi$ -light nucleus and  $\pi$ -heavy nucleus. These results are meant to give predictions for the planned experiments at the HADES spectrometer in GSI, Darmstadt. These reactions may be studied in JPARC, too.
