Contribution ID: 40

Type: **not specified**

The Physics of High Baryon Density

Wednesday, 15 October 2014 11:05 (45 minutes)

A Beam Energy Scan (BES) program was carried out at RHIC with the main goals to find signatures for the disappearance of the QGP, a QCD phase transition, and for a critical point. I will give an overview of various observables studied by STAR and PHENIX to identify those structures in the QCD phase diagram. Furthermore I will give an outlook on the BES phase II program which is anticipated for the years 2018-2019.
