The dual representation as a tool to check expansion methods

Tuesday, 18 February 2014 14:30 (30 minutes)

Rewriting the partition sum in its dual representation allows us to solve the sign problem exactly in several systems. Therefore we can use the results obtained with the dual representation as a reference test for other approaches. For example, I will show a comparison between the dual representation and different expansion methods, which are also used in full QCD at finite density.
