

# Atomki nuclear astrophysics activities

**atomki** MTA

Atomki:  
Institute for Nuclear Research,  
Hungarian Academy of Sciences

ATOMKI associated partner of NAVI

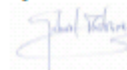

Dear Dr. Fulop,

On Behalf of the Nuclear Astrophysics Virtual Institute (NAVI) it is a pleasure for me to welcome the ATOMKI nuclear astrophysics group as associated partner.

The Nuclear Astrophysics Virtual Institute (NAVI) was setup on September 2011 funded by the Helmholtz Association with the objective of coordinate the nuclear astrophysics activities in Germany. It has been recently very positively evaluated by an international panel and our funding is currently secured till August 2016. NAVI coordinates the nuclear astrophysics activities of three Helmholtz Centers (GSI, FZJ, HZDR), five different German universities (Bonn, Darmstadt, Frankfurt, Giessen, Würzburg), the Frankfurt Institute for Advanced Studies, the Max-Planck Institut für Kernphysik Heidelberg with colleagues from France (GANIL and IPHC), Switzerland (Basel University) and the United States (JINA). It combines theoretical and experimental research focused on two main topics: stellar hydrogen and helium burning and r-process nucleosynthesis. The experimental research includes work on stellar reaction cross sections at underground laboratories like the Felsenkeller in Dresden as well as at the fore-front radioactive ion-beam facilities in Europe (GSI and GANIL) and in the US (NSCL at MSU). In addition to ATOMKI we have also as associated partners the nuclear astrophysics groups at the University of Edinburgh and ITEP (Moscow) and the Center for Nuclear Astrophysics in Shanghai that aims to coordinate Nuclear Astrophysics in China in similar way that NAVI does in Germany.

NAVI will benefit from the p-process expertise of ATOMKI and we look forward to many successful collaborations.

Sincerely,

Gabriel Martínez Pinedo

# ATOMKI Accelerator Centre

- **Running:**
  - Compact cyclotron K=20
  - 5MV electrostatic accelerator
    - Microbeam (OXFORD)
  - 1MV electrostatic accelerator
- **Recently installed:**
  - Accelerator Mass Spectrometer
    - (ETH Zürich + Isotoptech SME)
- **Under installation:**
  - 2MV tandem (HV)

AMS system for  $^{14}\text{C}$ : archaeology, climate, medical applications

# 2MV Tandem

## Other facilities

- Standalone ECR
- ESCA
- SNMS/XPS
- Hot chemistry lab.
- Isotope separator
- Mini-PET camera
- $^{60}\text{Co}$  irradiation
- TIER-3 GRID

radiochemistry

# Atomki astrophysics topics

- LUNA related
  - Same experiments at higher energies eg  ${}^3\text{He}(\alpha,\gamma){}^7\text{Be}$
  - Different experiments at higher energies eg  ${}^6\text{Li}({}^3\text{He},d){}^7\text{Be}$
  - Auxiliary experiments (half-lives, stopping power)
  - Feasibility studies (target properties)
- RIKEN RIB related
  - SAMURAI: Coulomb dissociation
  - BRIKEN: beta delayed neutron emission
  - Target chamber, detector development
- P-process studies (ERC + Eurogenesis + NAVI)

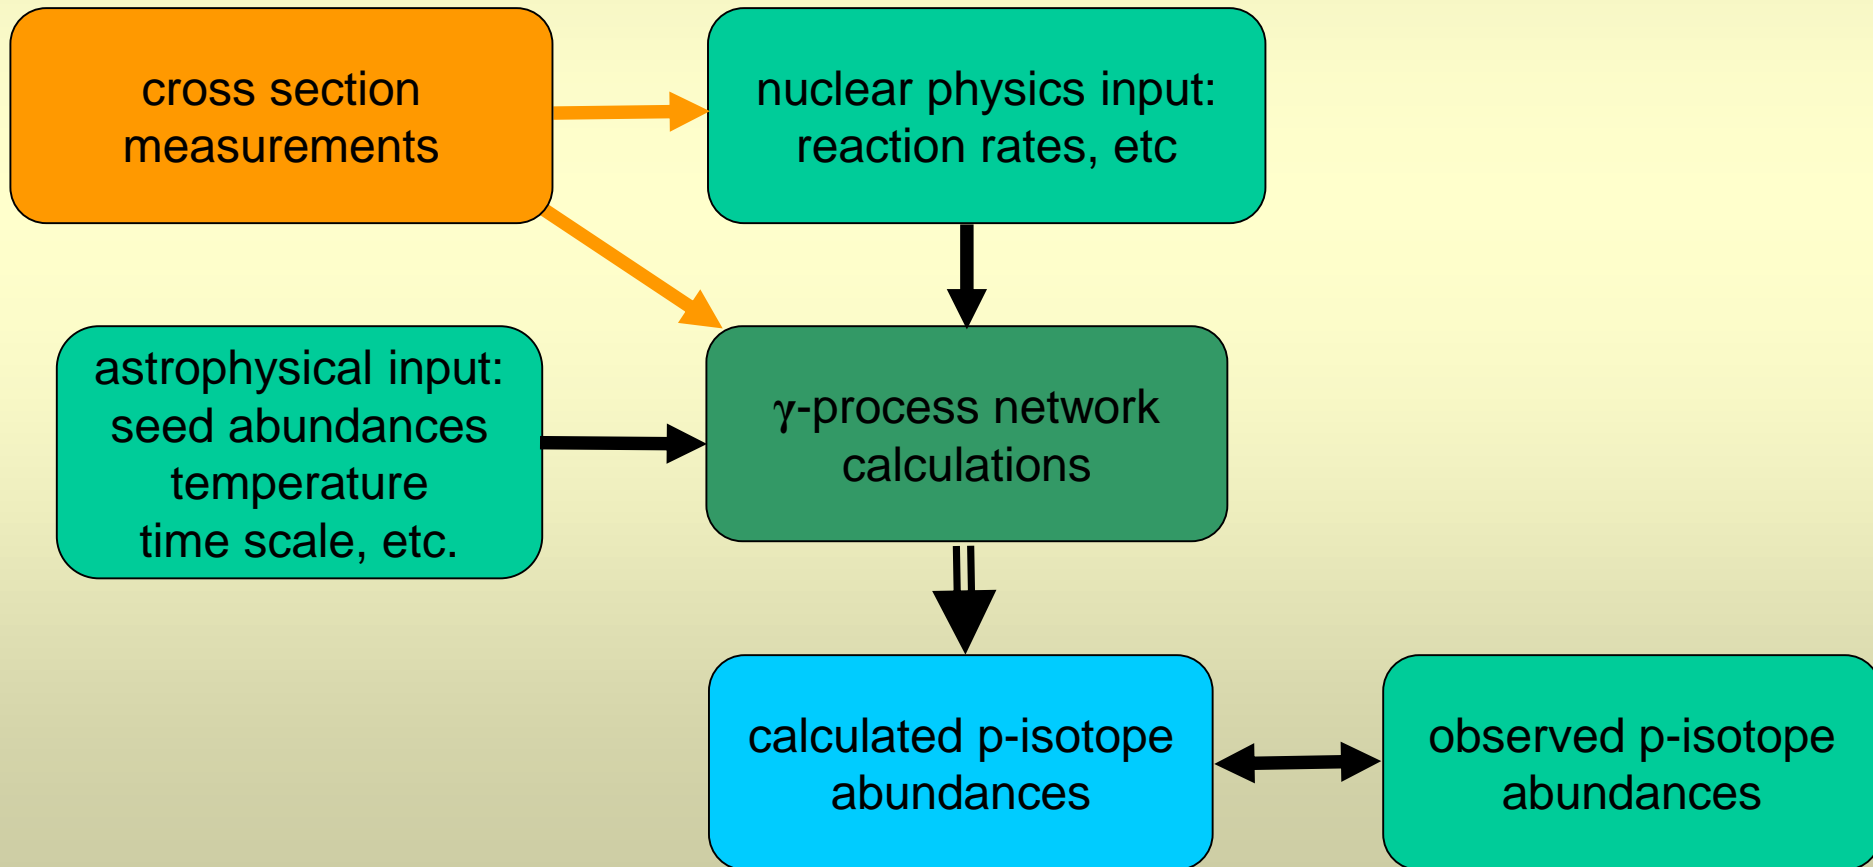

# Heavy element nucleosynthesis: a weak p-branch

- s- & r-processes  $\rightarrow$  99% of abundances
- p-process  $\rightarrow$  1%

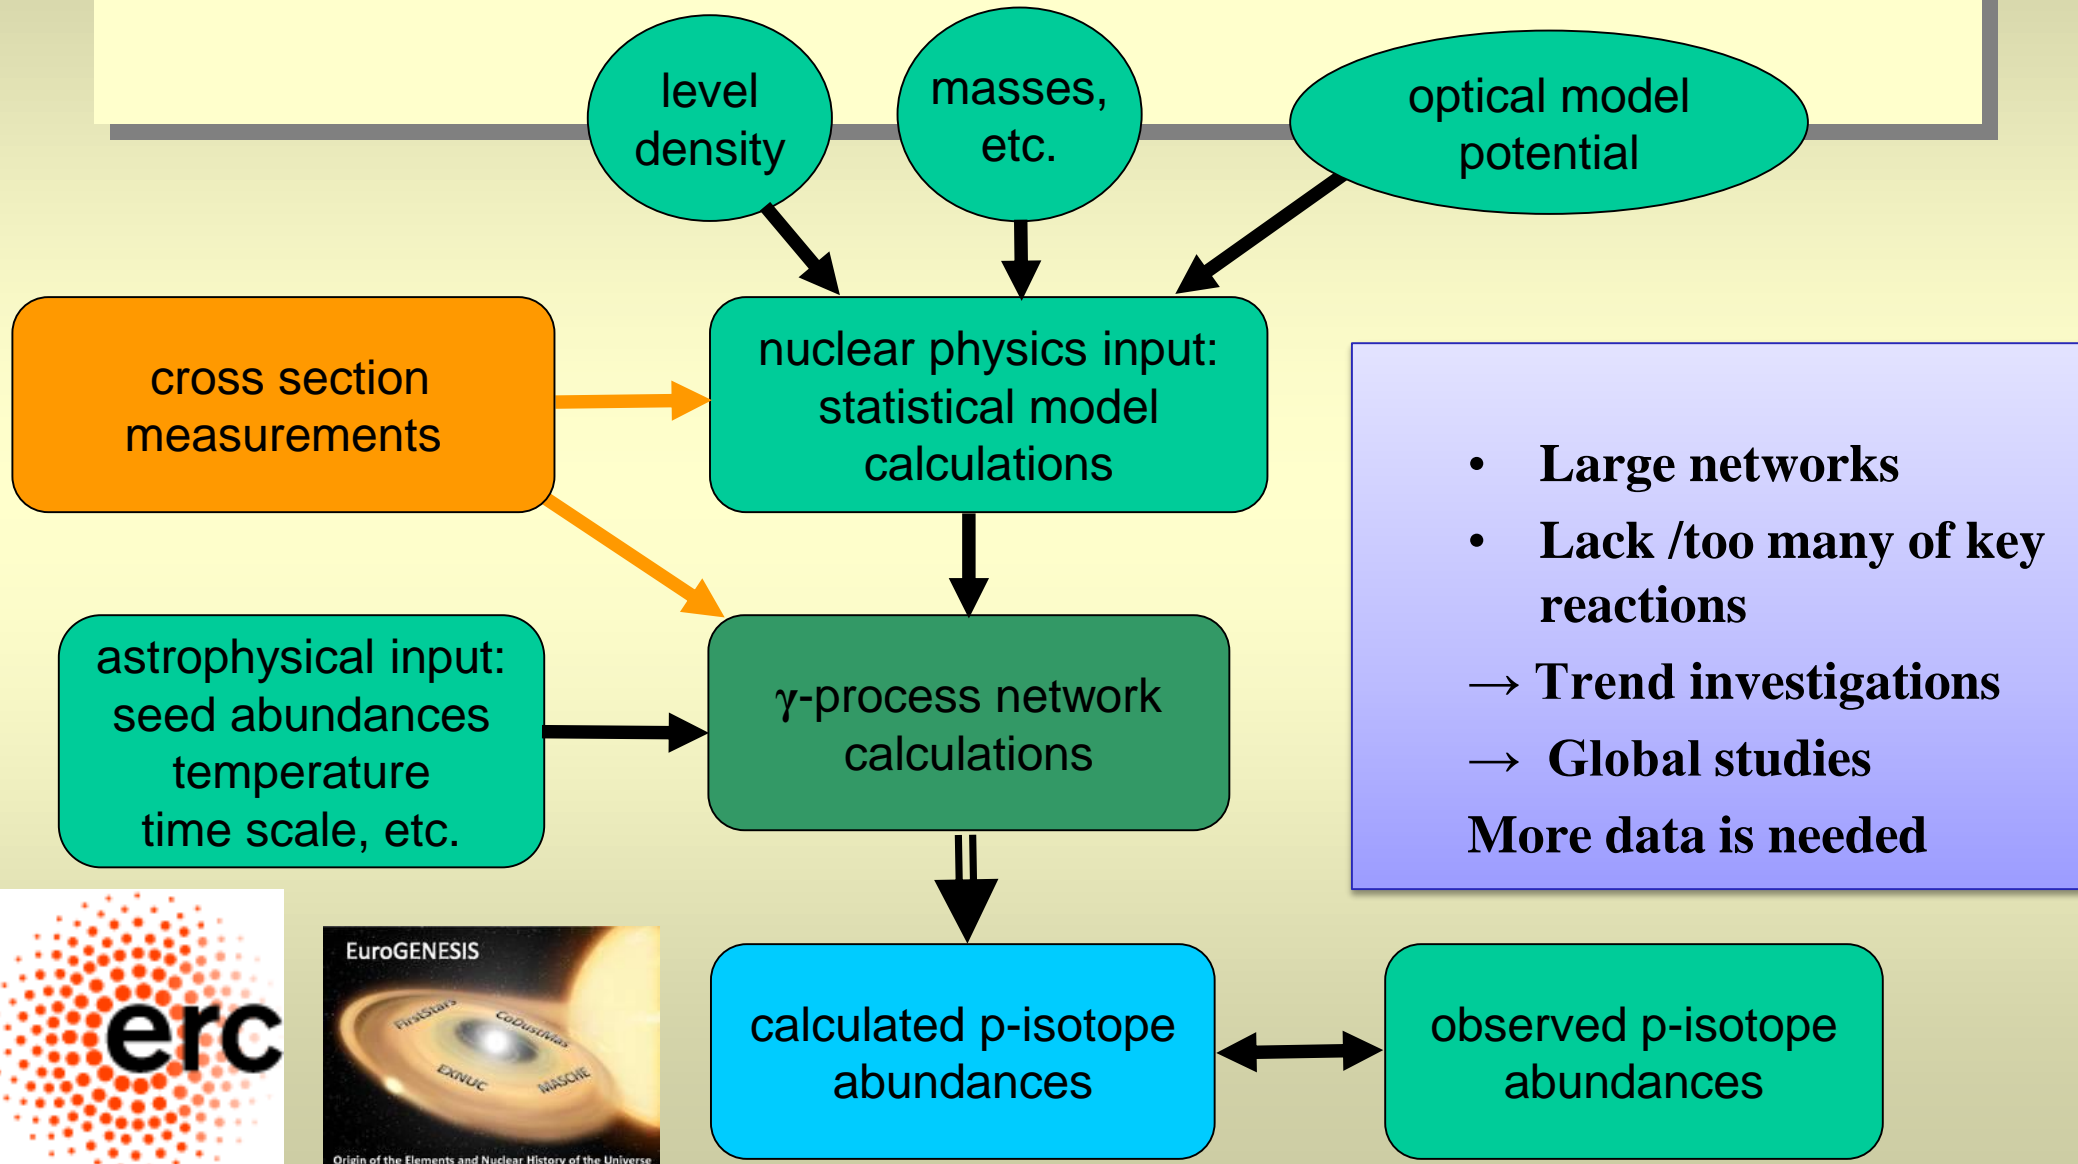

# $\gamma$ -process model calculations

# Input parameters of the statistical model

**ATOMKI aims:**

**Improve nuclear inputs for the gamma-process**

- Comprehensive analysis of nuclear data
  - Elastic alpha scattering
  - Alpha- and proton- induced reactions
- Extension of reaction database for heavy nuclei

Gamow window (T9=2-3): 3777.3 - 7807.6 MeV

<sup>70</sup>Ge(\*,)

T. Szücs and I. Dillmann

# $(p,\gamma)$ vs. $(\alpha,\gamma)$

## $(p,\gamma)$ : Higher cross sections, lower mass range

- Gamow window can be reached (no extrapolations)
- Highly enriched targets available
- Test ground for new methods (ESR, Coulomb breakup, ...)
- More data available (trend investigations)

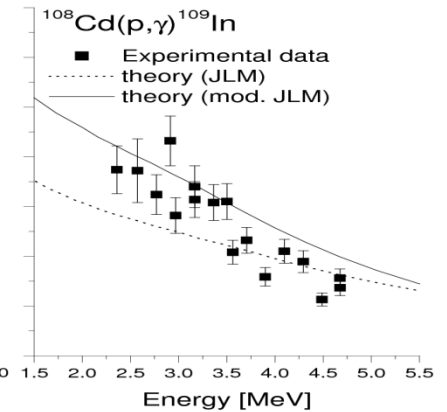

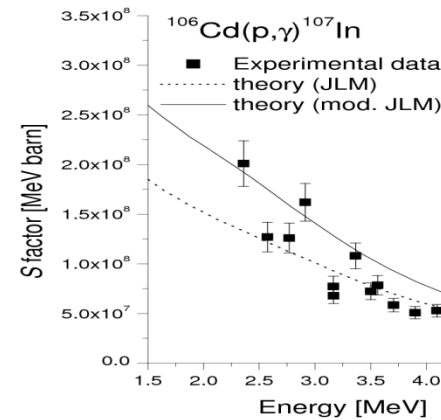

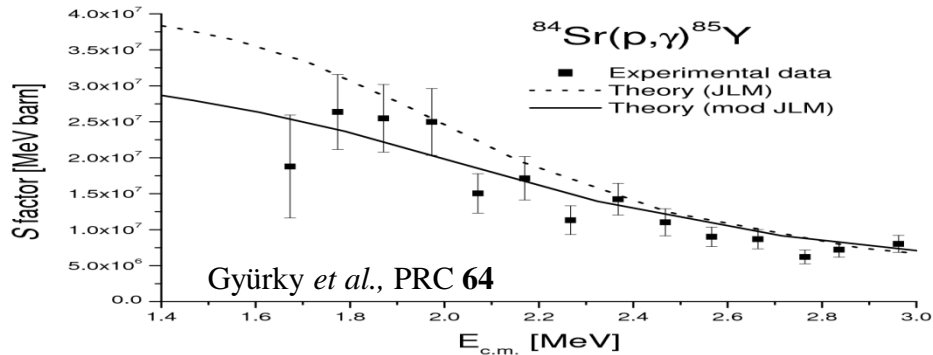

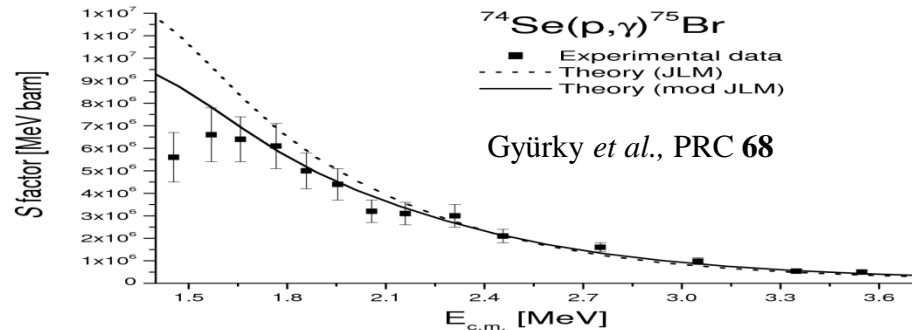

## $(\alpha,\gamma)$ : lower cross sections, higher mass range

- Experiments above Gamow window
- Expensive targets
- Auxiliary  $\alpha$ -potential studies to improve global potentials

# An improved proton optical potential

Increased imaginary strength by 70%

Gyürky *et al.*, J. Phys. G 34

G. G. Kiss *et al.*, PRC 76

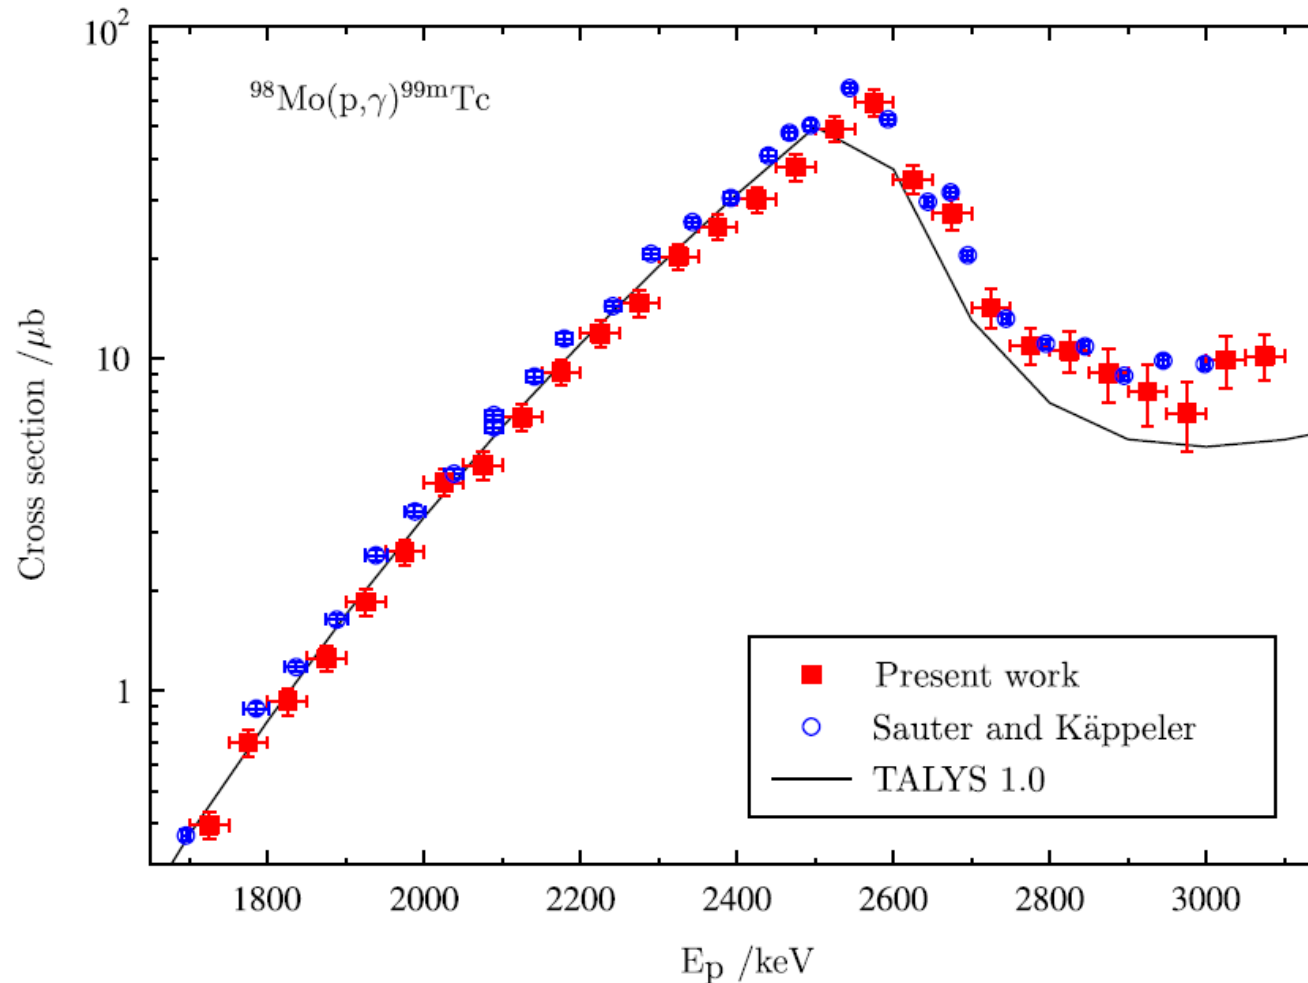

# $^{92}\text{Mo}(p,\gamma)$ thick target experiment

- Low mass: statistical model valid?
- Experiment of the Kappeler group: scattered data
- Target preparation problems

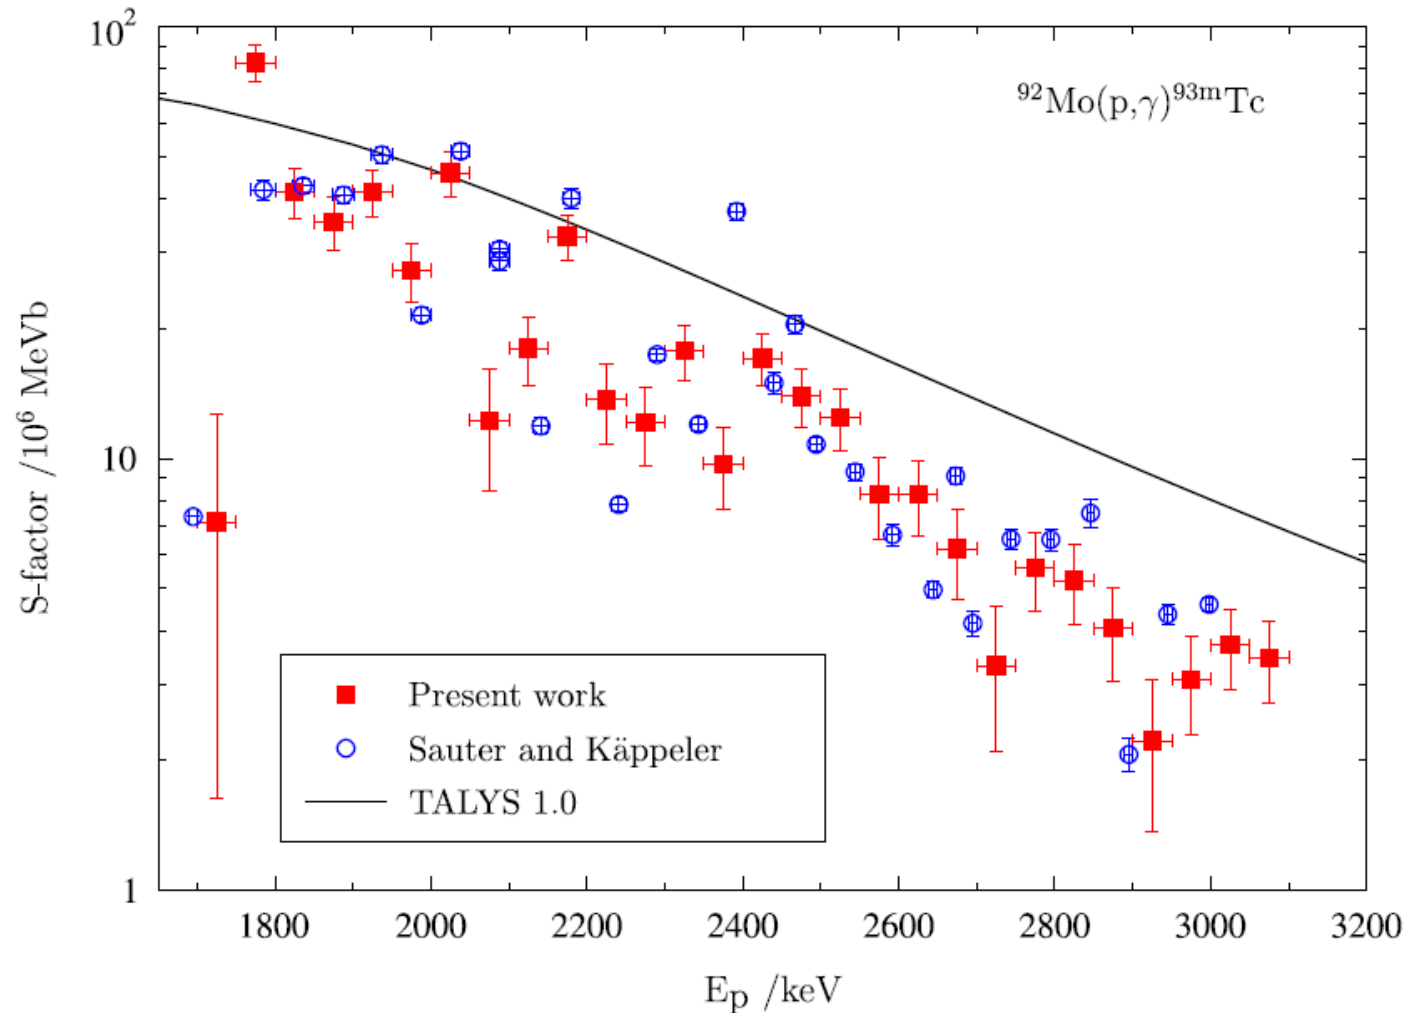

Reaction	Produced isotope	Half-life [hour]	Gamma-energy [keV]	Gamma-intensity [%]
$^{92}\text{Mo}(p,\gamma)$	$^{93g}\text{Tc}$	$2.75 \pm 0.05$	1363	$66.2 \pm 0.6$
			1477	$8.67 \pm 0.47$
			1520	$24.4 \pm 0.8$
$^{92}\text{Mo}(p,\gamma)$	$^{93m}\text{Tc}$	$0.725 \pm 0.017$	392	$58.9 \pm 0.9$
			2645	$13.3 \pm 0.6$
$^{98}\text{Mo}(p,\gamma)$	$^{99m}\text{Tc}$	$6.0067 \pm 0.0005$	141	$89.0 \pm 0.3$

# $^{92}\text{Mo}(p,\gamma)$ thick target experiment

# $^{92}\text{Mo}(p,\gamma)$ thick target experiment

# (p,n) reactions

- Direct role in heavy element nucleosynthesis
- Can be used to disentangle p- and  $\gamma$ -strength
- Can be combined with (p, $\gamma$ ) activation experiments

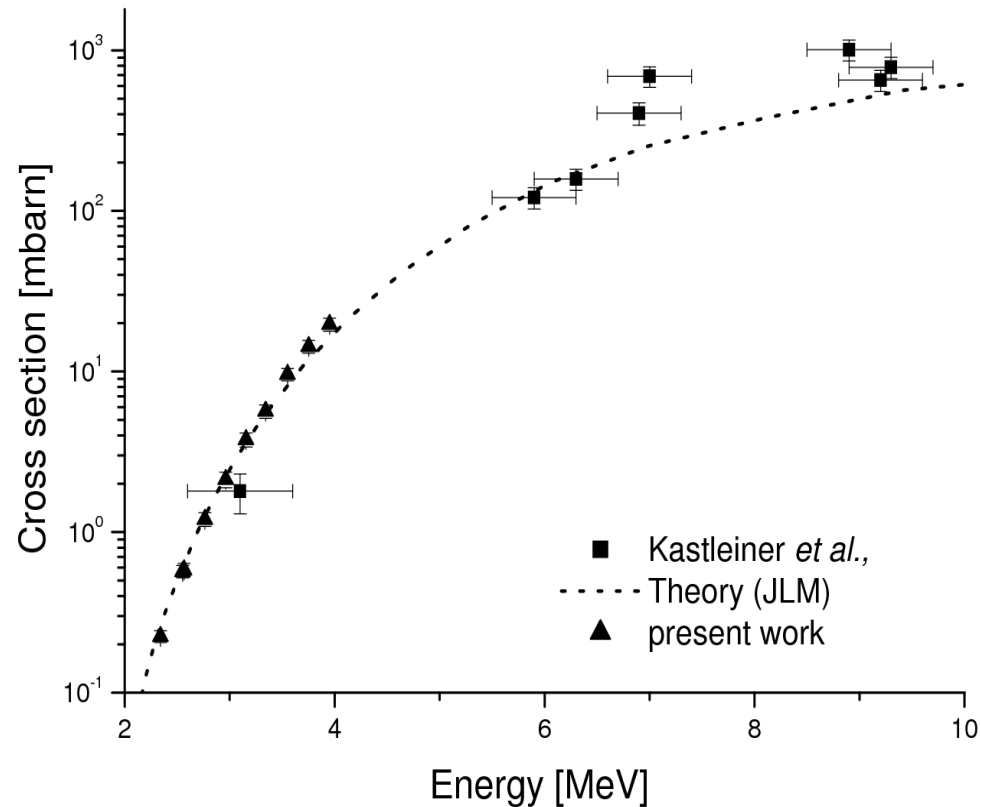

W. Rapp *et al.*,  
*Astrophys J.* **653**

# Example: $^{85}\text{Rb}(p,n)^{85}\text{Sr}$

G.G. Kiss et al: PRL **101**, 191101 (2008)

# **$(p,\gamma)$ vs. $(\alpha,\gamma)$**

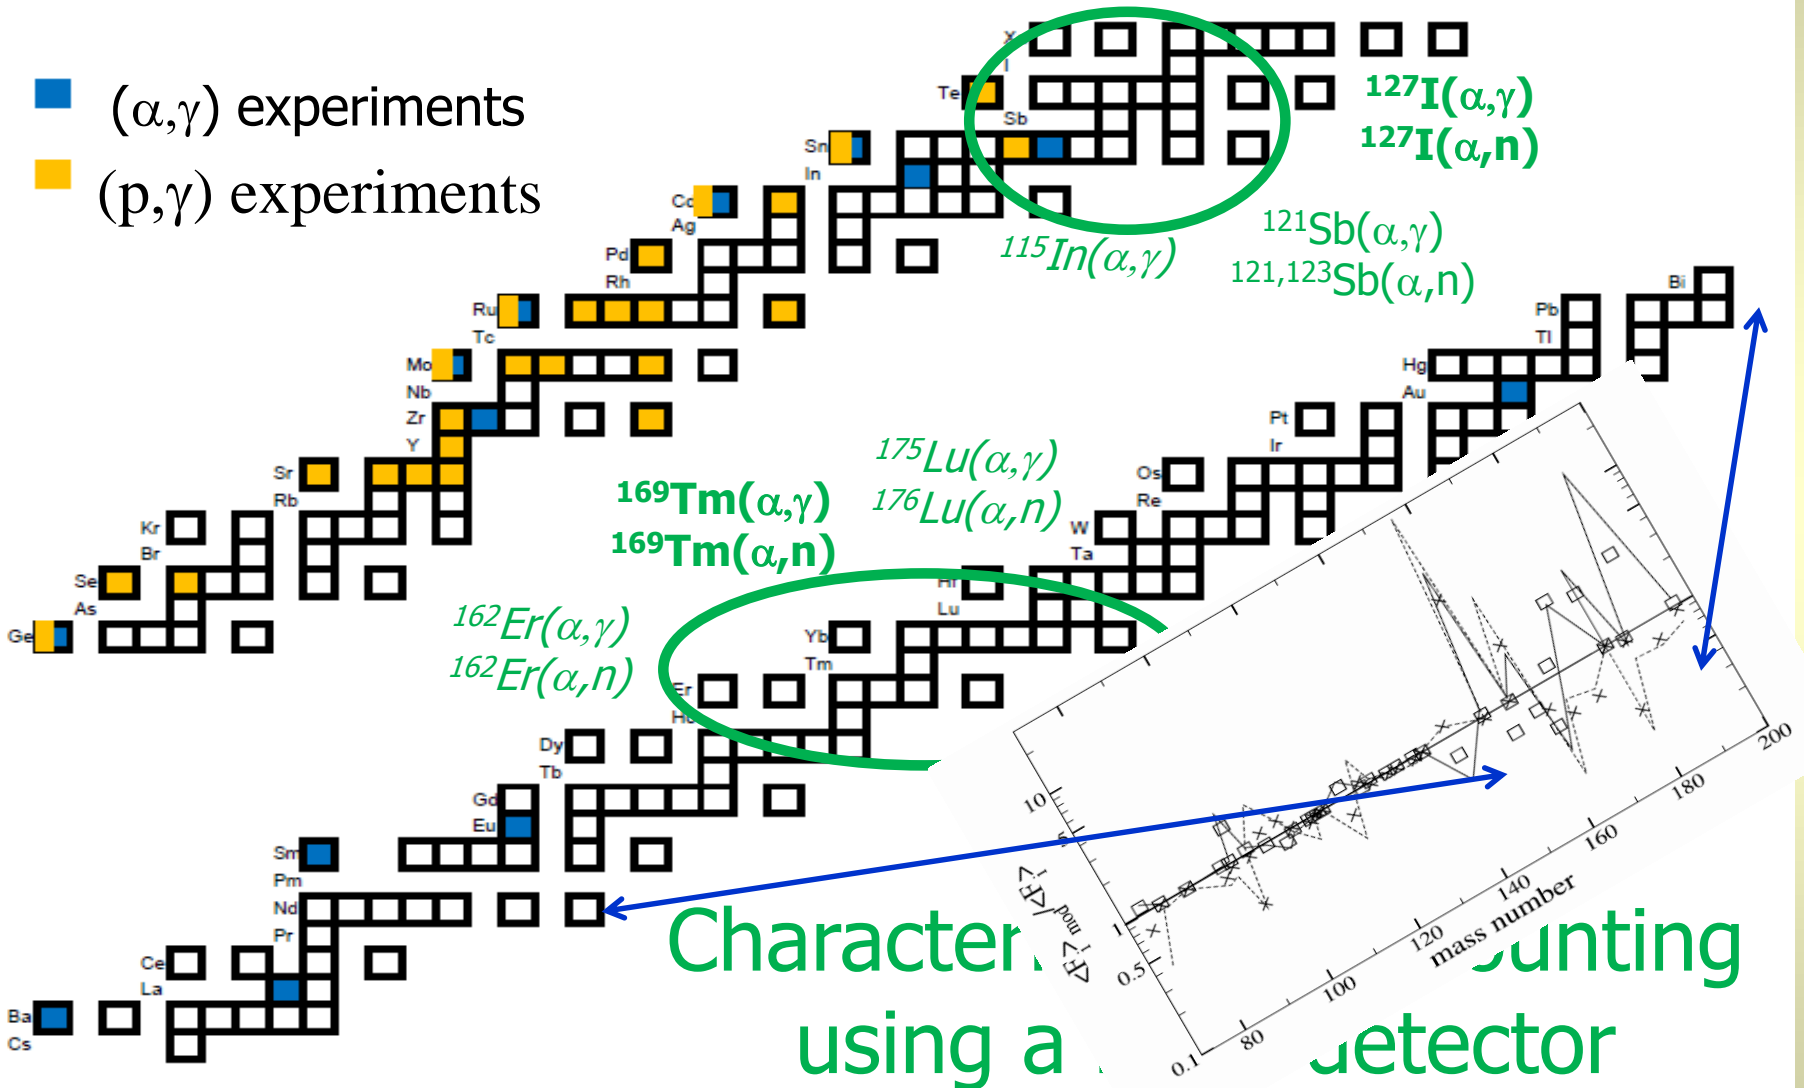

## **$(p,\gamma)$ : Higher cross sections, lower mass range**

- Gamow window can be reached (no extrapolations)
- Highly enriched targets available
- Test ground for new methods (ESR,  $4\pi$  summing...)
- More data available (trend investigations)

## **$(\alpha,\gamma)$ : lower cross sections, higher mass range**

- Experiments above Gamow window
- Target problems
- Auxiliary  $\alpha$ -potential studies to improve global potentials
- $(\alpha, n)$ ,  $(\alpha, p)$  channels also important

# Available sub-Coulomb database

# Activation method: serious limitations

- Poorly known nuclear parameters (branching,  $T_{1/2}$ )
  - Ancillary exp.
- Too long halflife
  - AMS:  $^{142}\text{Nd}(\alpha,\gamma)^{146}\text{Sm}$  ( $T_{1/2}=10^8$  y) @ANL
- Inadequate branching ratios (no  $\gamma$ -transition)

**Characteristic X-ray detection might help**

# Case study: $^{169}\text{Tm}(\alpha, \gamma/n)^{173/172}\text{Lu}$

decay characteristics:

Residual nucleus	Decay mode	Half-life [d]	Energy [keV]	Relative intensity per decay [%]
$^{173}\text{Lu}$	$\epsilon$ 100%	$500 \pm 3.65$	51.35 ( $K\alpha_2$ )	$43.8 \pm 1.4$
			52.39 ( $K\alpha_1$ )	$76.3 \pm 2.4$
$^{172}\text{Lu}$	$\epsilon$ 100%	$6.7 \pm 0.04$	51.35 ( $K\alpha_2$ )	$31.5 \pm 0.9$
			52.39 ( $K\alpha_1$ )	$54.9 \pm 1.5$
			810.06	$16.6 \pm 0.9$
			900.72	$29.8 \pm 1.3$
			912.08	$15.3 \pm 0.7$
		1093.63	$63.0 \pm 3.0$	

# $^{169}\text{Tm}(\alpha,\gamma)^{173}\text{Lu}$ - $^{169}\text{Tm}(\alpha,n)^{172}\text{Lu}$

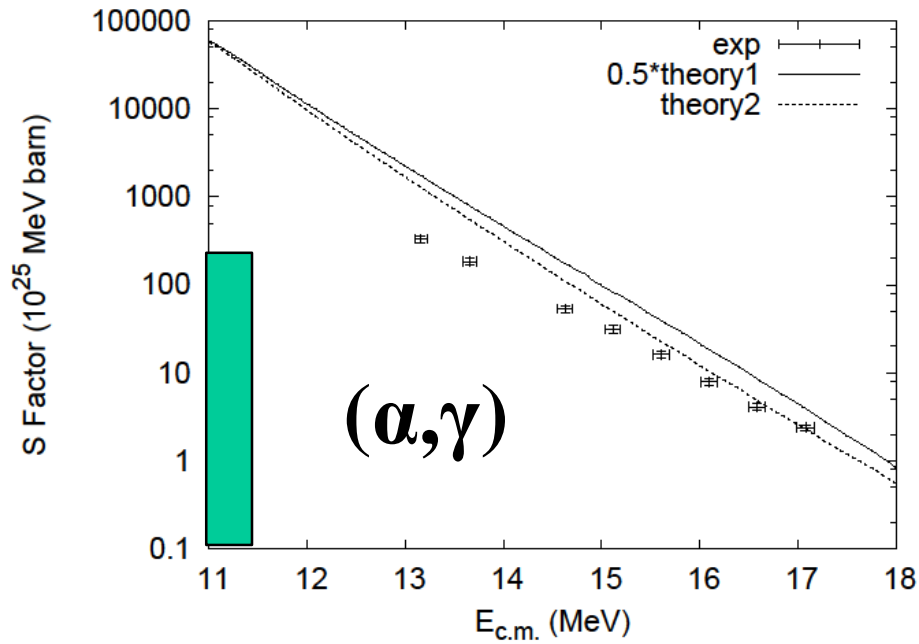

## LEPS detector

# $^{169}\text{Tm}(\alpha,\gamma)^{173}\text{Lu} - ^{169}\text{Tm}(\alpha,n)^{172}\text{Lu}$

Curves: NON-SMOKER<sup>WEB</sup> with different  $\alpha$ -potentials

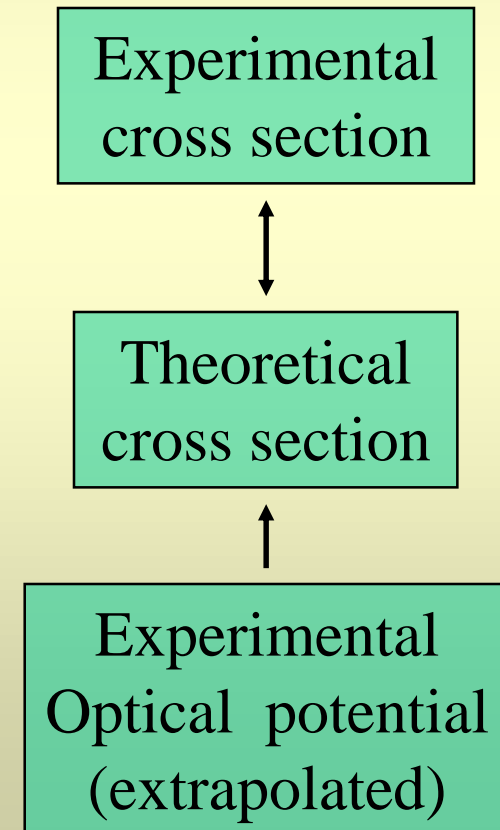

## X-ray detection: ( $\alpha,\gamma$ ) possibilities at heavy mass

Target nucleus	Target Z	Half life [d]	Gamow window [20] ( $T_9 = 3.5$ GK) [MeV]	$E_{\min}$ HPGe [MeV]	$E_{\min}$ LEPS [MeV]
$^{156}\text{Dy}$	66	1.19	8.2 - 12.0	13.7	12.0
$^{162}\text{Er}$	68	2.36	8.5 - 12.1	12.8	11.4
$^{175}\text{Lu}$	71	665	8.6 - 13.0	not possible	15.1
$^{191}\text{Ir}$	77	186.1	8.8 - 12.2	not possible	16.5

# $(\alpha, \alpha)$ experiments at low energies

Experimental constraints on the optical model parameters in the  $A > 100$  region

- ATOMKI/Darmstadt/Basel collaboration
- Experiments at ATOMKI Cyclotron
- Precision scattering chamber
- ~100% enriched targets
- Experimental constraints on the optical model parameters in the  $A > 100$  region
- Alternative:  $(n, \alpha)$  studies

# Comprehensive description of $^{112,124}\text{Sn}(\alpha,\alpha)$

High precision:  
uncertainties <3-4%  
(data basis average:  
~15%)

New features of  
exp. data

New opportunities  
also for model  
understanding
