## Universal quark/gluon ratio & turbulent nature of jet quenching

*Tuesday, 22 May 2018 14:30 (30 minutes)*

We investigate the radiative break-up highly energetic quark and gluon jets due to medium-induced Bremsstrahlung in a high-temperature plasma. We find that within an inertial range of momenta  $T \ll p \ll E$ , where  $E$  denotes the energy of the jet and  $T$  the temperature of the medium, the quark/gluon ratio of fragments is identical for quark and gluon jets and approximately given by the ratio of moments of the in-medium splitting functions for the  $q \rightarrow qg$  and  $g \rightarrow gg$  processes. We demonstrate how this behavior can be understood analytically by considering the turbulent nature of the radiative break-up process and discuss prospects for experimental measurements and implications for early time dynamics of heavy-ion collisions.
