

# ICP based Software Alignment at Lumi

Progress Report

Roman Klasen | [roklasen@uni-mainz.de](mailto:roklasen@uni-mainz.de)

# Software vs. Hardware Alignment

## Hardware Alignment

Measurements of component positions with:

- Laser Trackers
- Theodolites
- Rulers
- etc.

## Software Alignment

Determination of component positions with:

- measurement data
- cosmic rays
- etc.

Both methods give actual positions of components. **This talk is about software only.**

# Shift Detector vs. Shift Data

## Shift Detector

- Realistic Detector Acceptance
- Realistic scenario for Track Finder, Fitter etc.
- But need to generate MC Data again (esp. If you want multiple misaligned geometries)

## Shift Data

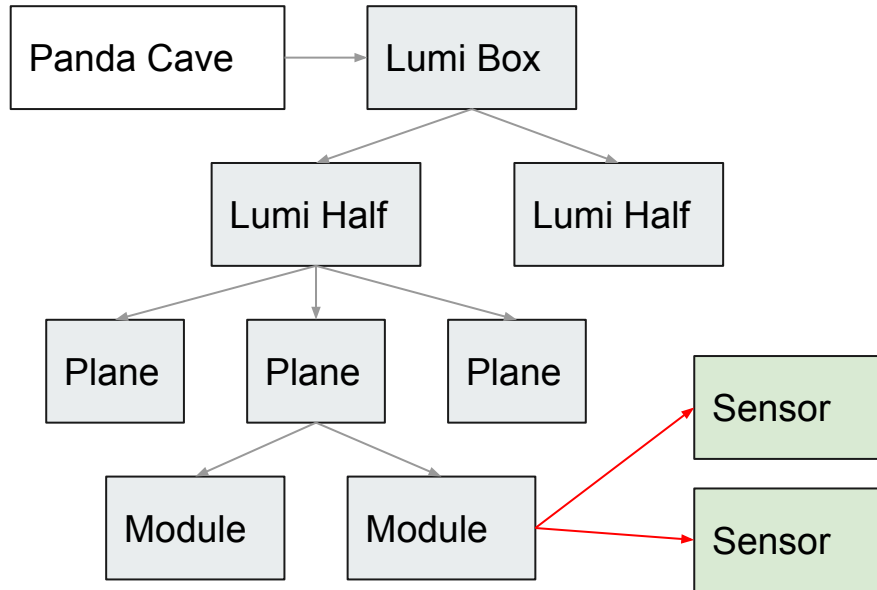

- Can use existing MC data
- Wrong detector acceptance may lead to implausible tracks:
- Don't see some tracks that should be there
- See tracks that can't be there

**I shifted the detector components and generated new MC data on which the Software Alignment ran.**

# Lumi Example

# Alignable Components

# Sensor Alignment with overlapping Areas

- Use overlaps to get matrix  $s_1 \rightarrow s_2$
- Go from sensor to sensor to reach all sensors
- Need one sensor as reference

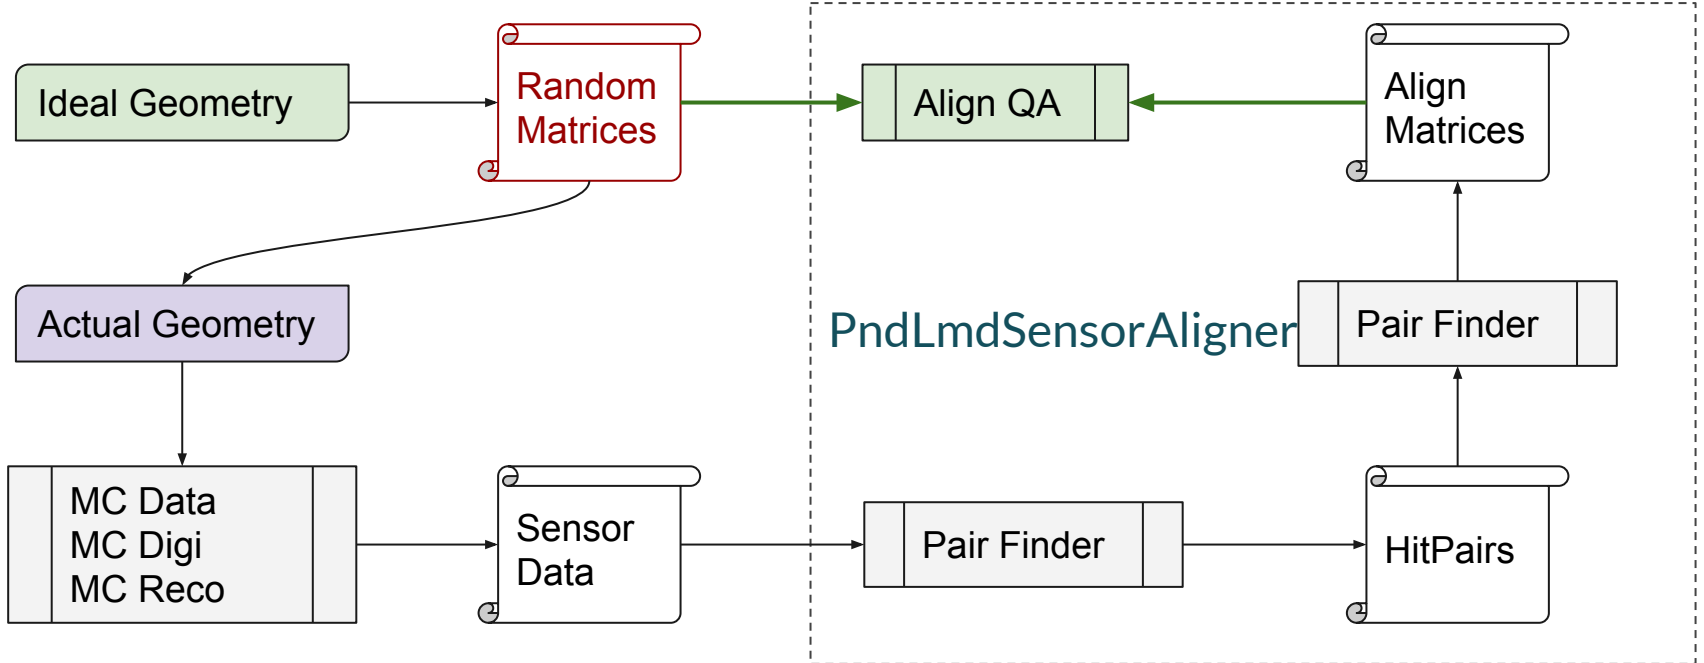

# Software Parameters

- We used multiple Geometries
- We Misalign Sensors only
- We allow XY Shift and z-Rotation only
- Enough data for  $\sim 10^5$  pairs/area

We can reach all sensors just by stepping from sensor to sensor by their overlapping areas

We compare the found alignment matrices with the ones provided to the simulation

# Estimate Quality of Alignment

# Misalign Parameters

Use a fixed relation shift -> rotation

We'll use these shorthands

- $0\mu$  : perfect geometry
- $10\mu$  :  $10\mu\text{m}$  shift,  $250\mu\text{rad}$  rot
- $50\mu$  :  $50\mu\text{m}$  shift,  $1.25\text{mrad}$  rot
- $100\mu$  :  $100\mu\text{m}$  shift,  $2.5\text{ mrad}$  rot
- $200\mu$  :  $200\mu\text{m}$  shift,  $5.0\text{ mrad}$  rot

# $o\mu$ - perfect geometry

matrixCM - correctionTarget,  $\Delta X$

matrixCM - correctionTarget,  $\Delta\alpha$

# 10 $\mu$ - misaligned geometry

matrixCM - correctionTarget,  $\Delta X$

matrixCM - correctionTarget,  $\Delta\alpha$

# 50 $\mu$ - misaligned geometry

matrixCM - correctionTarget,  $\Delta X$

matrixCM - correctionTarget,  $\Delta\alpha$

# 100 $\mu$ - misaligned geometry

matrixCM - correctionTarget,  $\Delta X$

matrixCM - correctionTarget,  $\Delta\alpha$

# 200 $\mu$ - misaligned geometry

matrixCM - correctionTarget,  $\Delta X$

matrixCM - correctionTarget,  $\Delta\alpha$

# Conclusion

Software alignment using the overlapping areas of two sensors using an ICP algorithm works.

The results are consistent even when the misalignment between two sensors is large.
