# Layout

- **Motivation**
- **General considerations**
- **Decay study of  $^{247}\text{Md}$**
- **Decay study of  $^{250}\text{Md}$**
- **Disagreements in the discovery of  $^{244}\text{Md}$**
- **Summary and conclusions**

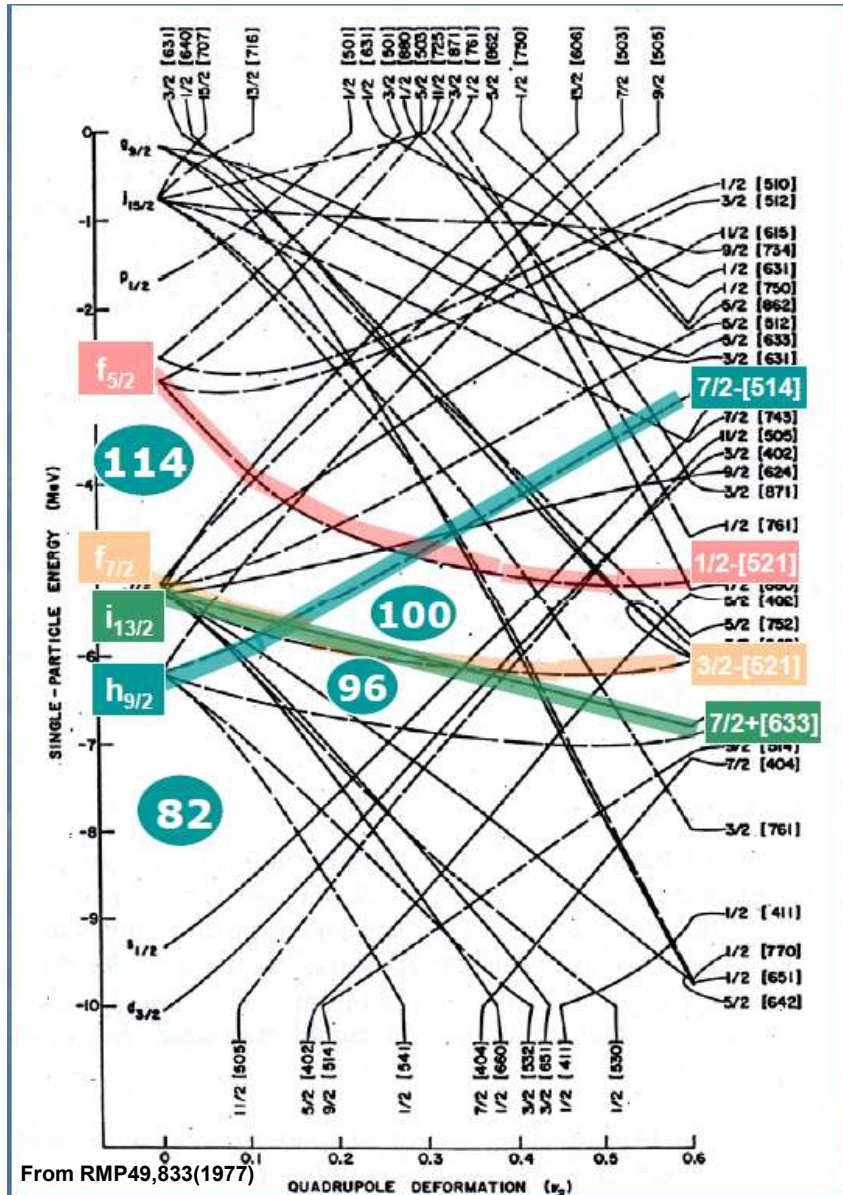

# Decay properties of odd-mass mendelevium isotopes

# Low lying levels in einsteinium isotopes experiment and predictions

## Structure of odd-mass einsteinium isotopes - some aspects

## Motivation for decay studies of odd-mass mendelivium isotopes

- Identify ground-state in daughter isotopes  $^{247,245,243}\text{Es}$
- Obtain more information on low lying levels in odd-mass einsteinium isotopes

### Why $^{247}\text{Md}$ ?

- ,high' transmission of SHIP only for ,heavy' beams
- Md-isotopes  $A \geq 249$  can only produced indirectly by  $\alpha$ - or EC - decay; background from decay of mother nucleus disturbs search for  $\gamma$ -transitions of low intensity
- only  $^{247}\text{Md}$  can be produced directly; no large area tellium targets available
- relatively high cross section of  $\approx 6$  nb for  $^{209}\text{Bi}(^{40}\text{Ar}, 2n)^{247}\text{Md}$
- $^{40}\text{Ar}$  - beams of high intensity available ( $\gg 1 \mu\text{A}$ )
- detailed investigation of  $^{245}\text{Md}$  not accepted by GSI - PAC (2005)

# Velocity separator SHIP

## SHIP

Separation time: 1 – 2  $\mu$ s  
Transmission: 20 – 50 %  
Background: 10 – 50 Hz  
Det. E. resolution: 18 – 25 keV  
Det. Pos. resolution: 150  $\mu$ m  
Dead time: 25  $\mu$ s

# Decay studies of $^{247}\text{Md}$ at SHIP

- 1980: discovery of  $^{247}\text{Md}$  (5  $\alpha$ -decays); my first new isotope !!!  
 →  $E_\alpha = 8428 \pm 25$  keV,  $T_{1/2} = 2.9 + 1.7 / - 1.2$  s (G. Münzenberg et al. ZPA 302,7 (1981))
  - 1993: discovery of  $^{247\text{m}}\text{Md}$  (S. Hofmann et al. GSI Scientific Report 1993, 64 (1994))  
 →  $^{247}\text{Md}$ :  $E_\alpha = 8424$  keV,  $T_{1/2} = 1.12 \pm 0.22$  s;  $^{247\text{m}}\text{Md}$ : SF,  $T_{1/2} = 0.23 + 0.19 / - 0.12$  s;
- 2001/2003:  $\alpha$ - $\gamma$  – decay studies of  $^{247}\text{Md}$   
 (F.P. Heßberger et al. EPJA 26, 233 (2005); S. Antalic et al. EPJA 43,35 (2010))

$^{243\text{g}}\text{Md}$ :  
 $E_\alpha = 8424 \pm 10$  keV,  
 $T_{1/2} = 1.2 \pm 0.1$  s,  
 $b_{\text{SF}} < 0.1\%$

$^{247\text{m}}\text{Md}$ :  
 $E_\alpha = 8783 \pm 40$  keV,  
 $T_{1/2} = 0.25 \pm 0.04$  s,  
 $b_\alpha = 79 \pm 5\%$   
 $b_{\text{SF}} = 21 \pm 5\%$

# New' decay study of $^{247}\text{Md}$ at SHIP (2007)

Irradiation time: 157 h  
Beam intensity: 1.5 – 2  $\mu\text{A}$   
(0.93 – 1.24)  $\times 10^{13}$  part./s

$\Sigma\alpha$ (full energy events (stop detector) in pause)  
 $^{247g}\text{Md}$ : 3428  
 $^{247m}\text{Md}$ : 299  
 $\Sigma\text{SF}$ : 227

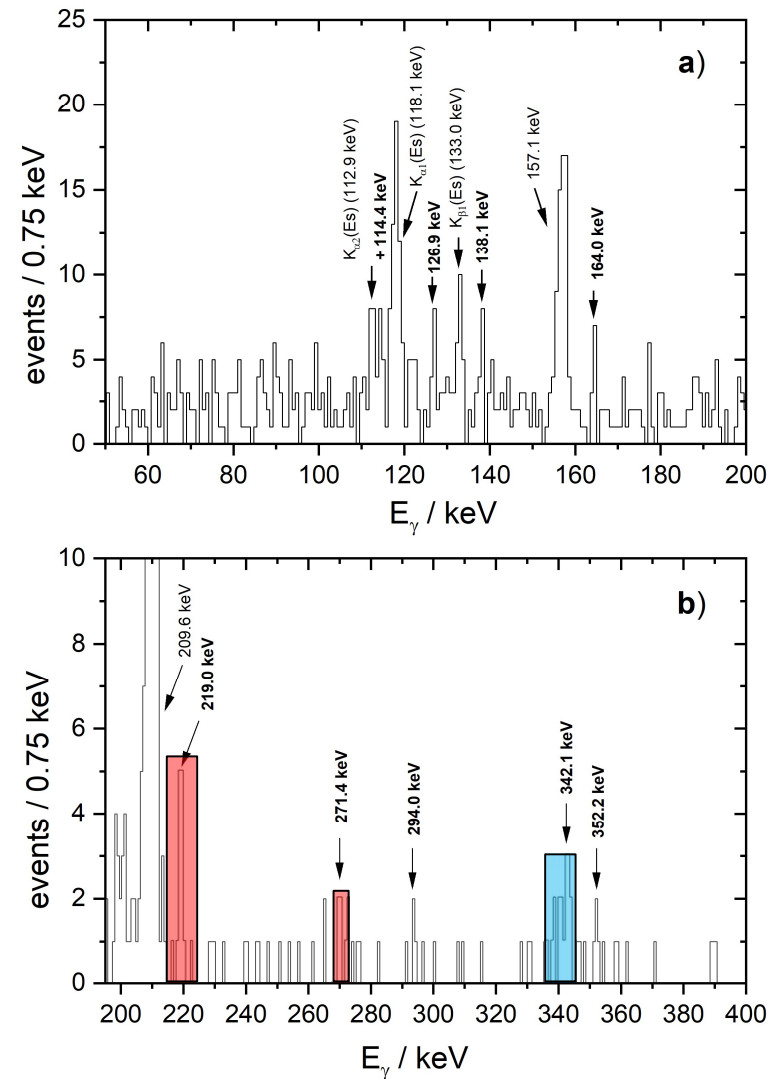

# 'New' decay study of $^{247}\text{Md}$ at SHIP (2007)

$T_{1/2}(\text{SF}) > T_{1/2}(\alpha, ^{247\text{m}}\text{Md})$

- interpreted as mixture of SF from  $^{247\text{m}}\text{Md}$  and  $^{247}\text{Md}$ ;
- $f(t) = A \times \exp(-\ln 2 \times t/T_{1/2}(^{247\text{m}}\text{Md})) + B \times \exp(-\ln 2 \times t/T_{1/2}(^{247}\text{Md}))$   
with  $A \approx 0.7$  and  $B \approx 0.3$

→  $b_{\text{SF}}(^{247\text{m}}\text{Md}) = 0.20 \pm 0.02$ ,  $b_{\text{SF}}(^{247}\text{Md}) = 0.0086 \pm 0.0010$

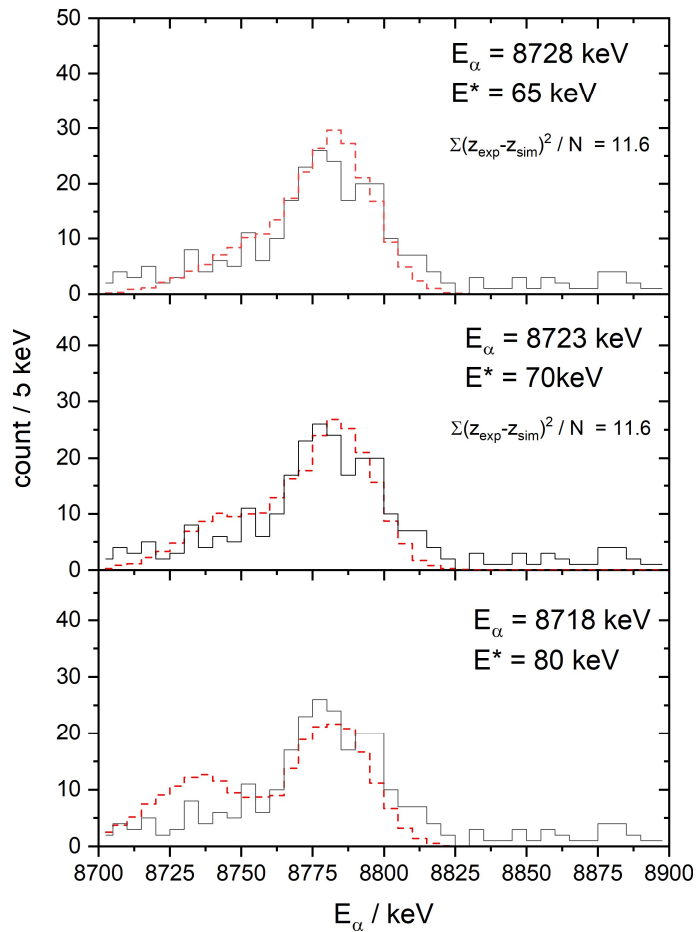

Sum of  $\gamma$  – events from 2001, 2003,  
and 2007 studies

# Proposed decay scheme of $^{247}\text{Md}$

GEANT simulations for  $\alpha$  – peak of  $^{247\text{m}}\text{Md}$

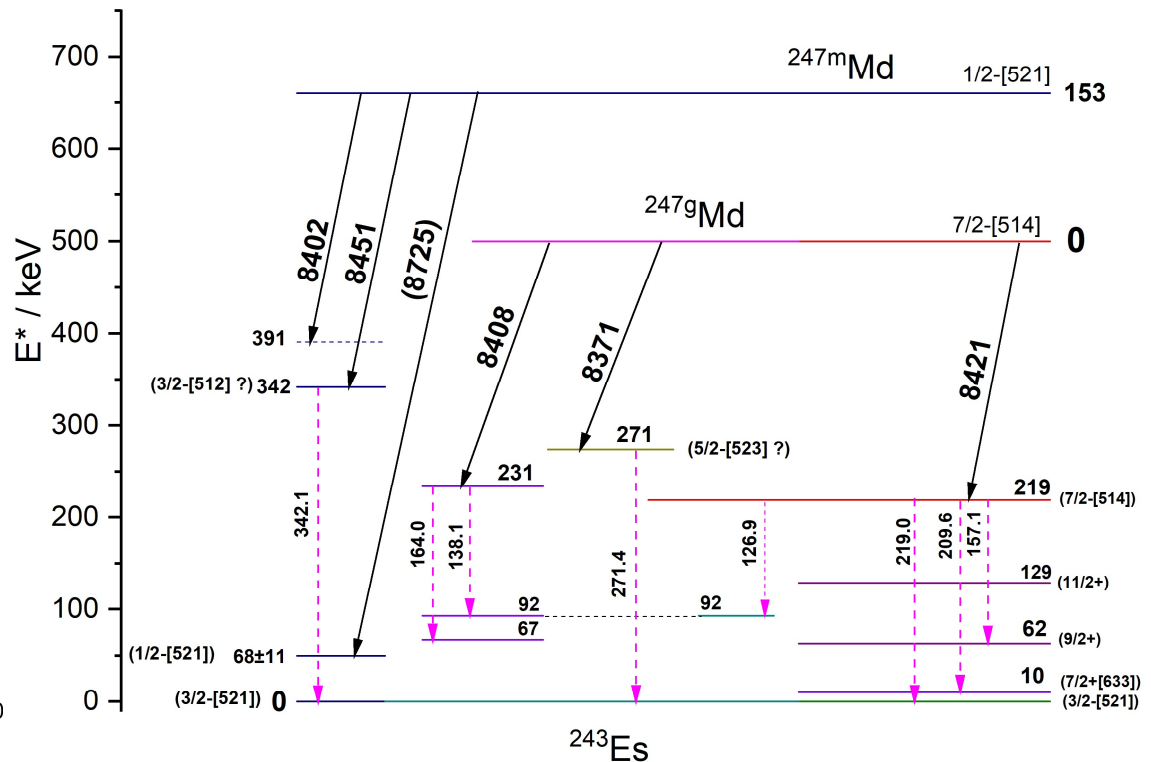

Basis:  $E_\alpha + E_\gamma = 8451 \text{ keV} + 342.1 \text{ keV}$   
 transition represents transition  
 into the ground-state

Performed by B. Andel

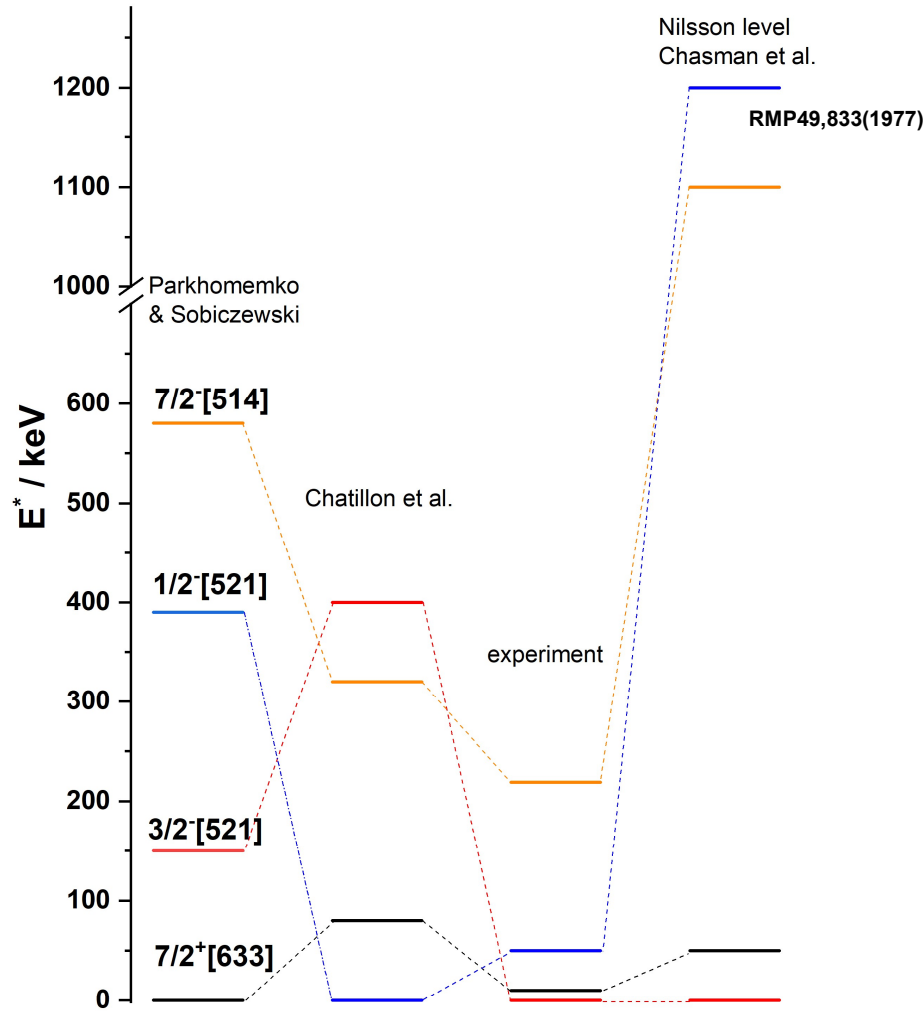

Assignments:

- $E_\gamma = 219.6 \text{ keV} \rightarrow E_\alpha = 8421 \text{ keV} \rightarrow$  decay from  $7/2$ -[514] – level into the ground-state
- $E_\gamma = 271.4 \text{ keV}$ ,  $E_\alpha = 8371 \text{ keV} \rightarrow$  decay into the ground-state due to Q-value
- $E_\gamma = 342.1 \text{ keV}$  line assigned to isomer due to half-life:  $0.36 +0.27/-0.15 \text{ s}$

# <sup>247</sup>Md – levels – comparison with theory

From RMP49,833(1977)

# Decay study of $^{250}\text{Md}$

(M.Vostinar et al. EPJA 55:17 (2019))

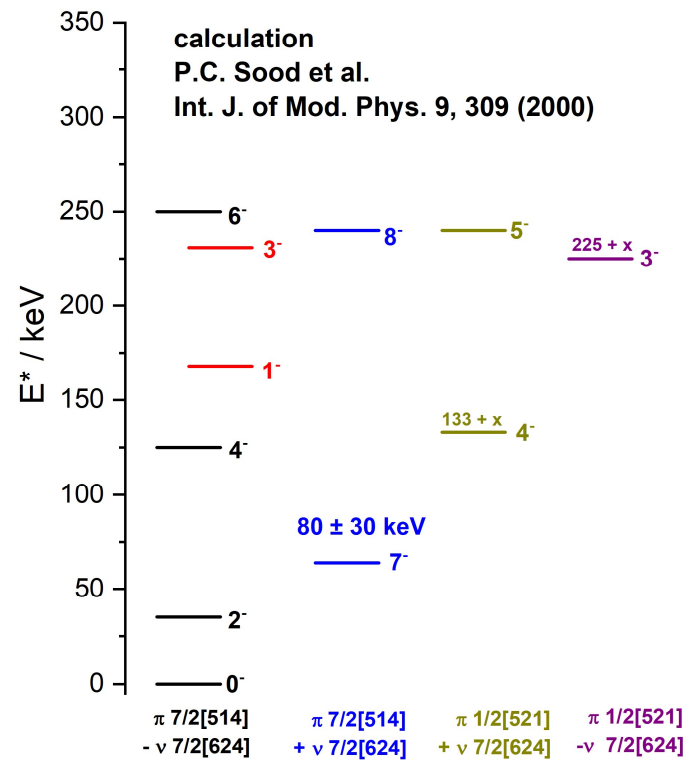

# Decay study of $^{250}\text{Md}$

## Decay scheme of $^{250g,250m}\text{Md}$

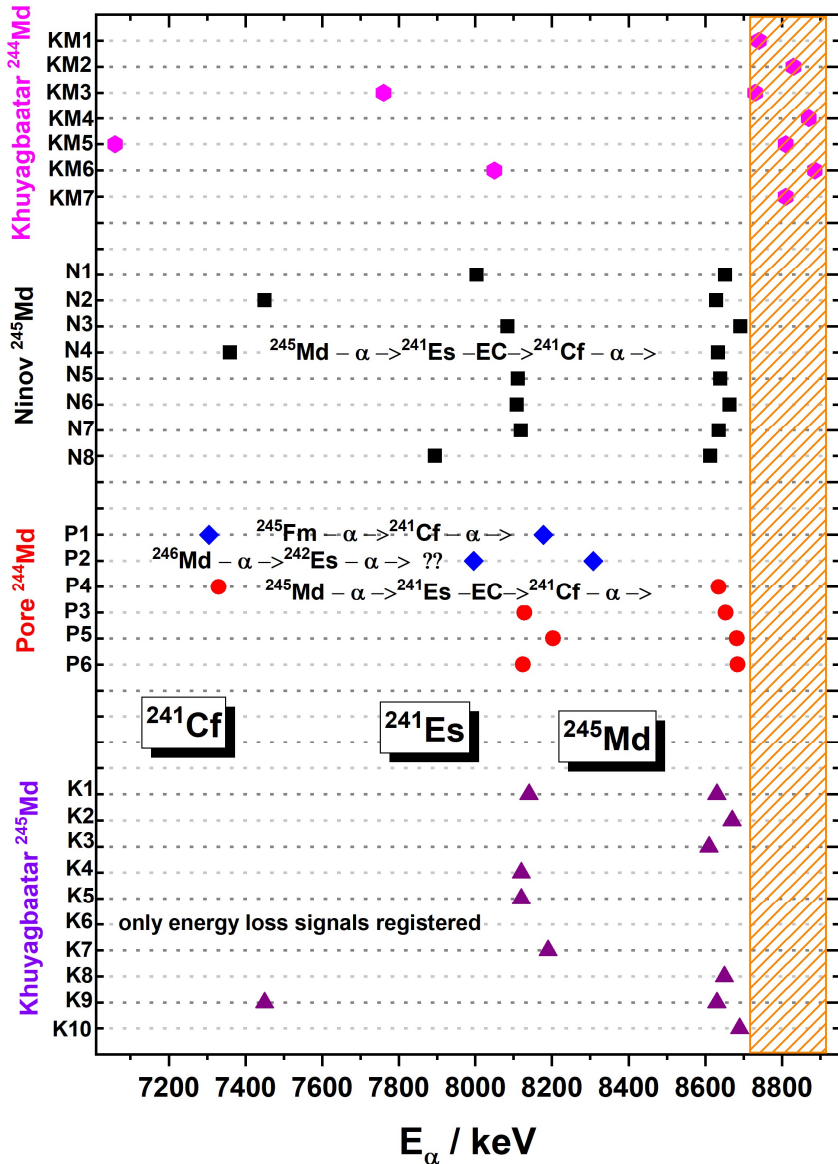

(M.Vostinar et al. EPJA 55:17 (2019))

Existence of isomeric state at  $E^* = 80 \pm 30$  keV of  $I^\pi = 7^-$  predicted by theory; spin and parity experimentally not established so far

# Disagreements in the discovery of $^{244}\text{Md}$

## Publications:

$^{245}\text{Md}$ : V.Ninov, F.P.Heßberger et al. Z.Phys. A356,11 (1996)

$^{244}\text{Md}$ : J.L.Pore et al. PRL 124, 252502 (2020)

$^{244,245}\text{Md}$ : J.Khuyagbaatar et al. PRL 125, 142504 (2020)

Comment on discovery: F.P.Heßberger et al. PRL 126, 182501 (2021)

Comparison of published data and excitation function indicate that events attributed to  $^{244}\text{Md}$  rather have to be attributed to  $^{245}\text{Md}$

# Summary and Outlook

- ☺ **New decay study provides an enhanced decay scheme of  $^{247}\text{Md}$ ; ground-state configuration of  $^{243}\text{Es}$  established; energy of  $^{247\text{m}}\text{Md}$  was determined**
- ☺ **Long-lived isomeric state in  $^{250}\text{Md}$ , predicted by theory, was identified**
- ☺ **Confusion about conflicting data on  $^{244}\text{Md}$  was solved; Berkeley data rather have to be attributed to  $^{245}\text{Md}$**
