History

Ross Ihaka and Robert Gentleman. R: A language for data analysis and graphics. *Journal of Computational and Graphical Statistics*, 5:299-314, 1996 (<http://www.jstor.org/stable/1390807>).

- R is a language for developing statistical software (open source (GPL)).
- R implements a version of the S language (designed at Bell Laboratories).
- R is a command line interpreter language similar to Perl or Python.
- Large number of packages (CRAN) for a wide range of applications exist (Machine Learning, Genetics, ...)
- Available on large number of platforms: Linux, Mac OS X, Windows, FreeBSD, ...

R command line interpreter

```
stibor@herkules:~>R
```

```
R version 2.13.0 (2011-04-13)
```

```
Copyright (C) 2011 The R Foundation for Statistical Computing
```

```
ISBN 3-900051-07-0
```

```
Platform: x86_64-unknown-linux-gnu (64-bit)
```

```
R is free software and comes with ABSOLUTELY NO WARRANTY.
```

```
You are welcome to redistribute it under certain conditions.
```

```
Type 'license()' or 'licence()' for distribution details.
```

```
  Natural language support but running in an English locale
```

```
.  
.
.
```

```
Type 'demo()' for some demos, 'help()' for on-line help, or
```

```
'help.start()' for an HTML browser interface to help.
```

```
Type 'q()' to quit R.
```

```
> all.equal((1+1/1000)^1000,exp(1))
```

```
[1] "Mean relative difference: 0.0004997918"
```

```
Run R scripts in batch mode: R CMD BATCH file.R or R --no-save < file.R
```

Basic Operations, Functions and Values

| operator, function, value | description |
|--|---|
| <code>^</code> or <code>**</code> | power |
| <code>*</code> , <code>/</code> | multiplication, division |
| <code>max()</code> , <code>min()</code> | maxima, minima |
| <code>abs()</code> | absolute value |
| <code>sqrt()</code> | square root |
| <code>round()</code> , <code>floor()</code> , <code>ceiling()</code> | rounds the values |
| <code>sum()</code> , <code>product()</code> | sum, product |
| <code>log()</code> , <code>log10()</code> , <code>log2()</code> | natural logarithm, base 10 log., base 2 |
| <code>exp()</code> | exponential function |
| <code>sin()</code> , <code>cos()</code> , <code>tan()</code> | trigonometric functions |
| <code>pi</code> | number π |
| <code>Inf</code> , <code>-Inf</code> | infinity |
| <code>NaN</code> | not a number |
| <code>NA</code> | not available |
| <code>NULL</code> | null object |

Lists, Vectors, Matrices

An R list is an object consisting of an ordered collection of objects known as its components.

```
X <- list(spot.name="Hookipa",
          n.windydays = 320, pi*c(1:10))
names(X)
unlist(X)
sum(unlist(X[3]))
X$spot.name <- "River_Gorge"
is.list(X)
# use a list to store different type of
# objects (matrices, vectors, scalars, etc.)
list.container <- list(mat = matrix(c(1,2,3,4),nrow=2),
                      vec = c(5,6,7,8), exp(1))
```

Lists, **Vectors**, Matrices

```
vec <- c(1:100)
# sum numbers 1,2,...,100
s <- 0
for(i in 1:length(vec))
  s <- s + vec[i]
# smarter and faster
sum(vec)

s <- 0
for(i in 1:length(vec))
  s <- s + sqrt(log(vec[i]))

sum((log(vec))^(1/2))

# dot product
x <- c(1:10); y <- c(11:20);
as.real(x %*% y)
```

Lists, Vectors, Matrices

```
S <- 1e03
n <- m <- matrix(runif(S*S,min=-10,max=0),nrow=S,ncol=S)
# avoid using for loops
system.time({
for(r in 1:nrow(m))
  for(c in 1:ncol(m))
    m[r,c] <- m[r,c]^2
})
# use apply, mapply, ....
system.time({n <- apply(m, 2, function(x) x^2)})

identical(m,n)
```

Lists, Vectors, Matrices

```
m <- matrix(rnorm(20),nrow=4,ncol=5)
# singular-value decomposition
svd.mat <- svd(m)
# reconstruct matrix m
n <- svd.mat$u %*% diag(svd.mat$d) %*% t(svd.mat$v)
all.equal(m,n)

# compute eigenvalues and eigenvectors
eigen(m %*% t(m))

# solve linear eq. system
A <- matrix(c(3,5,1,
              2,7,3,
              4,4,2), byrow=T, nrow=3)
y <- c(3,4,5)
s <- solve(A,y)
s <- as.matrix(s)
A %*% s == y
```

Functions

```
# recursive function
n.choose.k <- function(n,k) {
  if (k == 1)
    return(n)
  if (n == k)
    return(1)
  return( n.choose.k(n-1,k) + n.choose.k(n-1,k-1) )
}

# create 10 random tuples (x1,x2) \in {1,2,...,15}
# and verify whether n.choose.k is corrently computed
i <- 1;
while(i <= 20) {
  x <- sort(sample(size=2,x=c(1:15)), decreasing = TRUE)
  print(choose(x[1],x[2]) == n.choose.k(x[1],x[2]))
  i <- i + 1;
}
```

(Some) Distributions in R

| Distribution | R name | additional arguments |
|-------------------|--------|----------------------|
| beta | beta | shape1, shape2, ncp |
| binomial | binom | size, prob |
| Cauchy | cauchy | location, scale |
| chi-squared | chisq | df, ncp |
| exponential | exp | rate |
| gamma | gamma | shape, scale |
| geometric | geom | prob |
| hypergeometric | hyper | m, n, k |
| negative binomial | nbinom | size, prob |
| normal | norm | mean, sd |
| Poisson | pois | lambda |
| uniform | unif | min, max |
| Wilcoxon | wilcox | m, n |

Approximate π Example

```
N.vec <- c(5,50,100,500,1000,10000);

pdf("pi_estm.pdf", width = 10.0, height = 10.0);
par(mfrow=c(3,2));

for(N in N.vec) {

  x.y.rand <- matrix(runif(2*N, min=-1,max=1),nrow=N,ncol=2);

  bool.in.out <- ((x.y.rand[,1]^2 + x.y.rand[,2]^2) < 1);
  in.circle <- sum(bool.in.out);

  est.pi <- 4*in.circle/N;
  sprintf("Estimated value of Pi is %f\n", est.pi);

  text.res <- paste("Estimated value of Pi = ", format(est.pi, digits = 5),
                    ", error = ", format(abs(pi-est.pi), digits = 8), sep="");
  text.N <- paste("Number of points", N, sep="");

  plot(x.y.rand, xlim=c(-1,1), ylim=c(-1,1),
        xlab=text.N, ylab="", main=text.res,
        pch=19, cex=1.5, col=bool.in.out+2, asp=1);

  symbols(x=0, y=0, circles=1, inches=FALSE,
          xlim=c(-1,1), ylim=c(-1,1), add=TRUE, lwd=2);

}

dev.off();
```

Approximate π Example (cont.)

Markov Chain Example

Obtain a sample from a Markov chain specified by initial state vector and transition matrix.

```
States <- LETTERS[1:3] # three states A,B,C
init.pi <- c(0.6, 0.1, 0.3)
names(init.pi) = States

A <- matrix(c(0.2, 0.5, 0.3,
              0.6, 0.2, 0.2,
              0.1, 0.1, 0.8), byrow=T, nrow=3)
dimnames(A) = list(from = States, to = States)

l <- 10; # sample has l states
states <- c()
states <- c(states, sample(States, 1, prob = init.pi))
for (i in 2:l) {
  state = sample(States, 1, prob = A[states[i - 1], ])
  states = c(states, state)
}
```

CRAN Packages

Suppose you want to sample from a Bernoulli distribution.

```
> rbern
```

will not work. However, there exists (for sure) a CRAN package (<http://cran.r-project.org/web/packages/>).

```
> install.packages("Rlab")
```

```
* DONE (Rlab)
```

```
> library(Rlab)
```

```
> rbern(n=10, prob=1/3)
```

```
[1] 0 1 1 0 0 1 0 0 0 1
```

Environments for R

I personally prefer Emacs and the ESS packages

The screenshot shows the Emacs editor with the ESS (Emacs Speaks Statistics) package. The main window displays R code for a Markov chain simulation. A terminal window at the bottom shows system statistics and the help output for the 'sample' function.

```
1 States <- LETTERS[1:3] # three states A,B,C
2 init.pi <- c(0.6, 0.1, 0.3)
3 names(init.pi) = States
4
5 A <- matrix(c(0.2, 0.5, 0.3,
6             0.6, 0.2, 0.2,
7             0.1, 0.1, 0.8), byrow=T, nrow=3)
8 dimnames(A) = list(frown = States, to = States)
9
10 l <- 10; # sample has l states
11 states <- c()
12 states <- c(states, sample(States, 1, prob = init.pi))
13 for (i in 2:l) {
14   state = sample(States, 1, prob = A[states[i - 1], ])
15   states = c(states, state)
16 }
```

R Documentation

Random Samples and Permutations

Description:

'sample' takes a sample of the specified size from the elements of
'x' using either with or without replacement.

Usage:

sample(x, size, replace = FALSE, prob = NULL)

sample.int(n, size = n, replace = FALSE, prob = NULL)

Arguments:

x: Either a vector of one or more elements from which to choose,
or a positive integer. See 'Details.'

n: a positive number, the number of items to choose from. See
'Details.'
```

Good and easy to learn IDE is <http://www.rstudio.org/>.

Summary

R is a very powerful language for data analysis and graphics.

There are tons of features in R, I haven't considered in this brief overview. Go and explore the power and richness of R.
