

Update on the Bonn Tracking Station Data Analysis

Simone Bianco

29 XI 2010

- The Bonn Tracking Station:
 - ✓ Setup
 - ✓ DAQ to PANDARoot Conversion
 - ✓ Energy Calibration and Alignment
 - ✓ Scattering Measurements
 - ✓ Setup Optimization
 - ✓ Simulations

The Bonn Tracking Station

Experimental Setup:

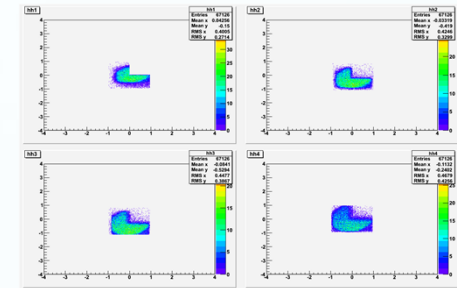

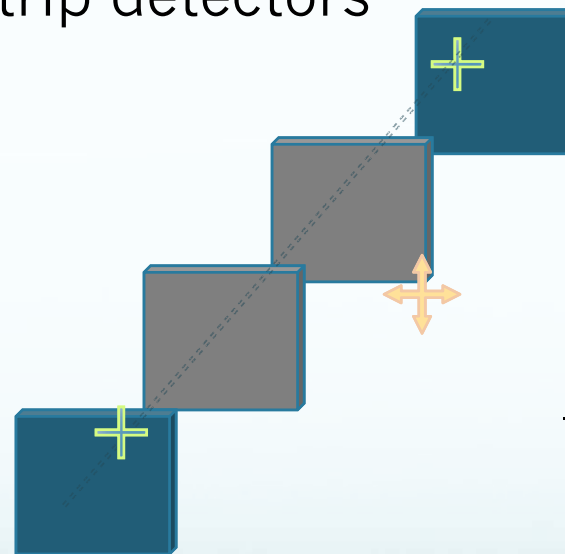

4 scintillators (for the trigger 3 out of 4)
2 double sided silicon strip detectors
4 single sided silicon strip detectors

Available beams:

Protons: 800 MeV/c
2.95 GeV/c
Electrons: 1 – 5 GeV

Scattering Volumes:

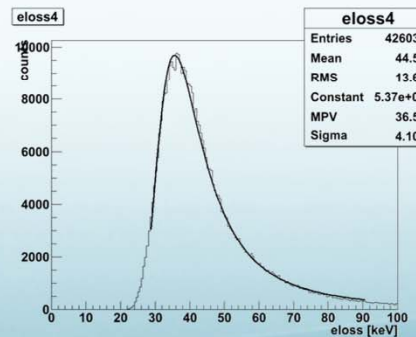

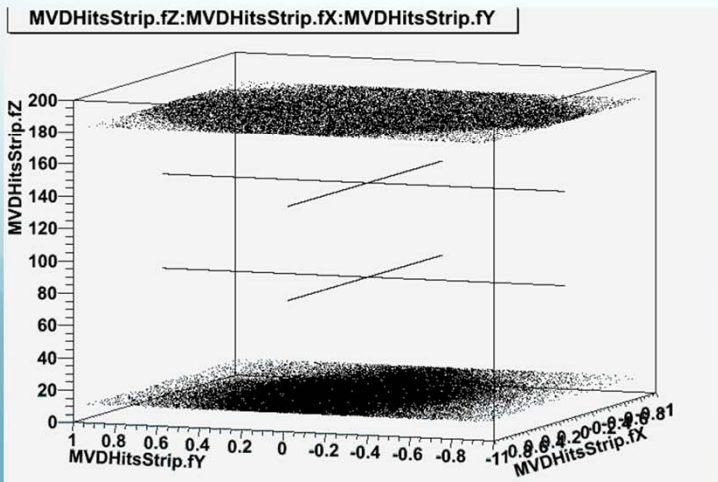

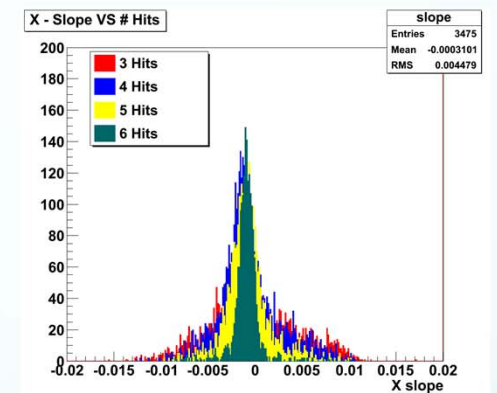

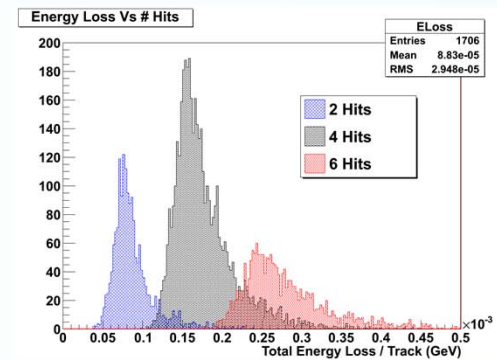

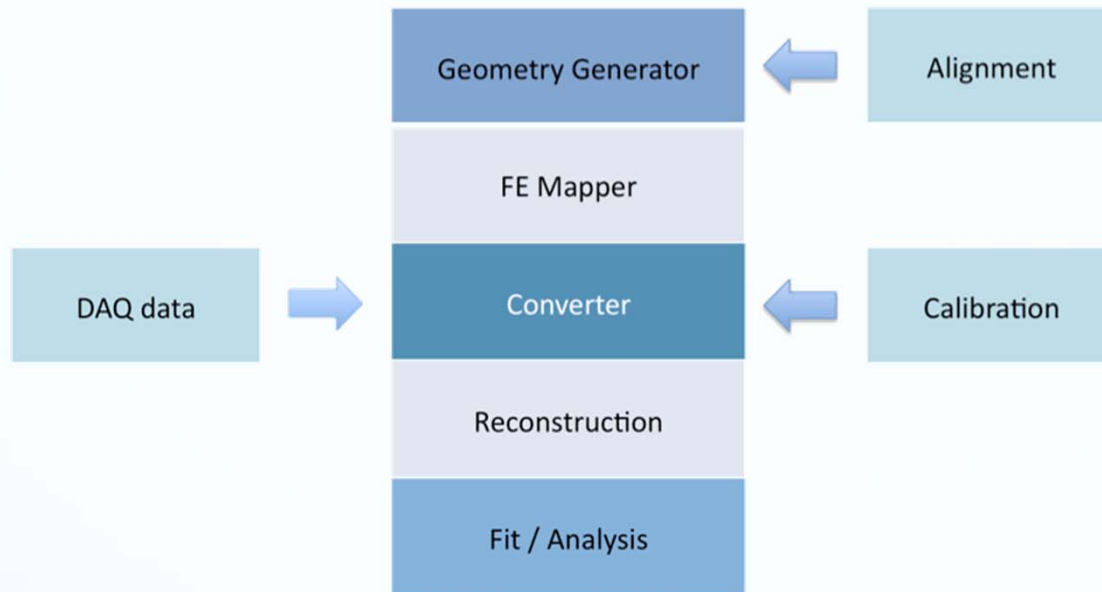

Carbon foil
Carbon Boxes (1 cm, 2 cm)

Software Tools:

Offline alignment
Calibration
DAQ → pandaroot
Analysis tools

DAQ to PANDAroot

Energy Calibration

Realized in two steps:

- ✓ Same charge injected on each of the FE channels
→ to resolve differences in the response
- ✓ MIP hypothesis
→ to set an absolute ADC counts-to-energy-loss scale

Alignment

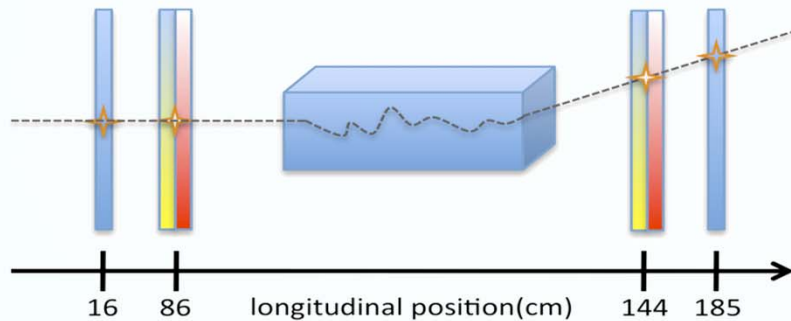

Iterative procedure to align sensors:

1. Measure residual on the 1st sensor
2. Correct the position of the 1st sensor
3. 2nd sensor... 6th sensor
4. Reiterate the whole loop

Scattering Measurements

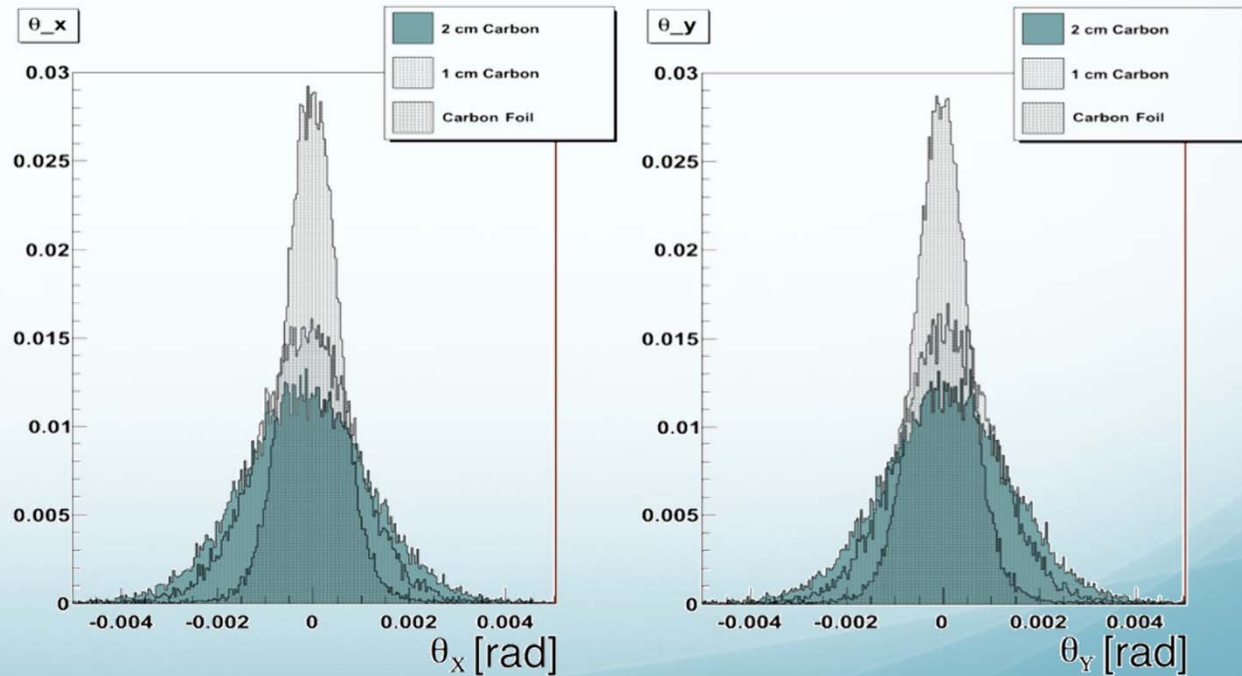

2 hits before the volume
2 hits downstream

Measurements of the scattering angle

Volumes:

- a carbon foil (0.6 mm thick)
- 1 cm of C-like material (1.79 g/cm^3)
- 2 cm of C-like material (1.69 g/cm^3)

Beam: 2.95 GeV/c protons

Scattering – Measured Data

GEANT3 → Sigma 0.001011

2.95 GeV/c protons scattering in:
 ↗ 1 cm of C-like material
 ↘ 2 cm of C-like material

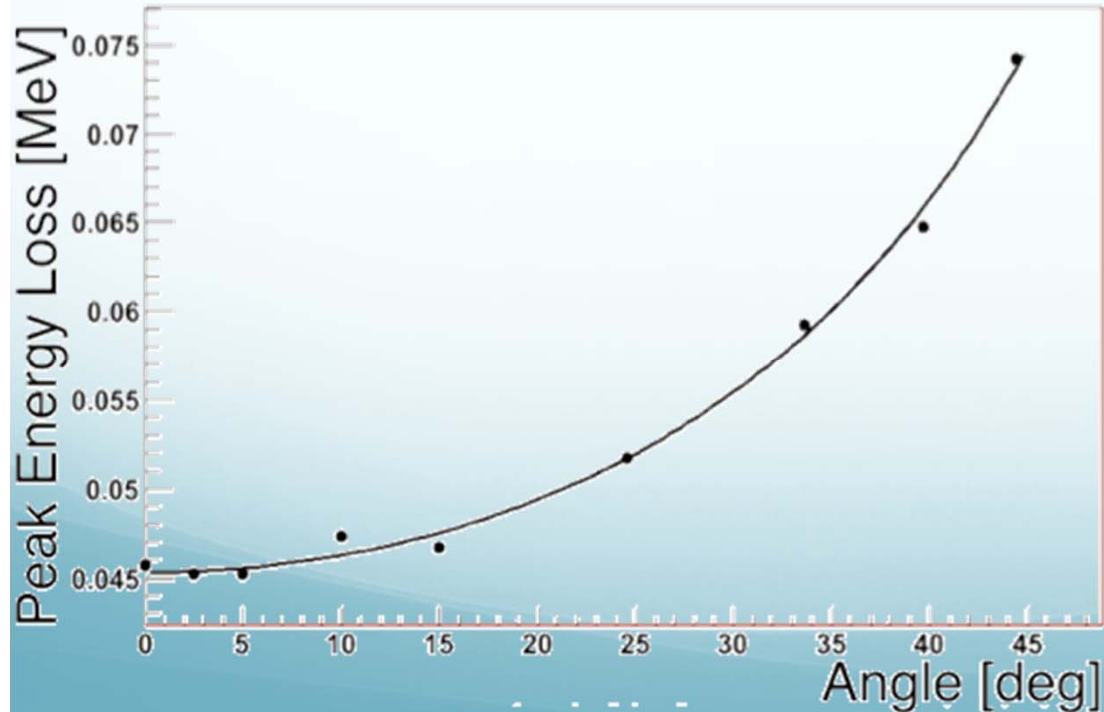

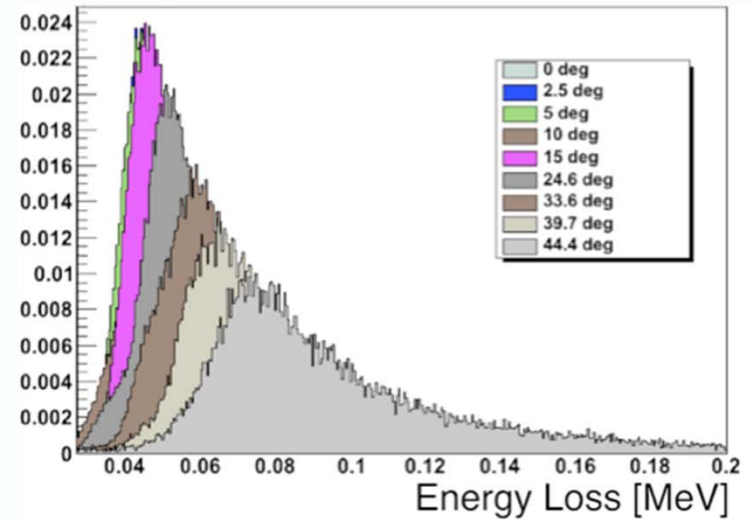

GEANT3 → Sigma 0.001334

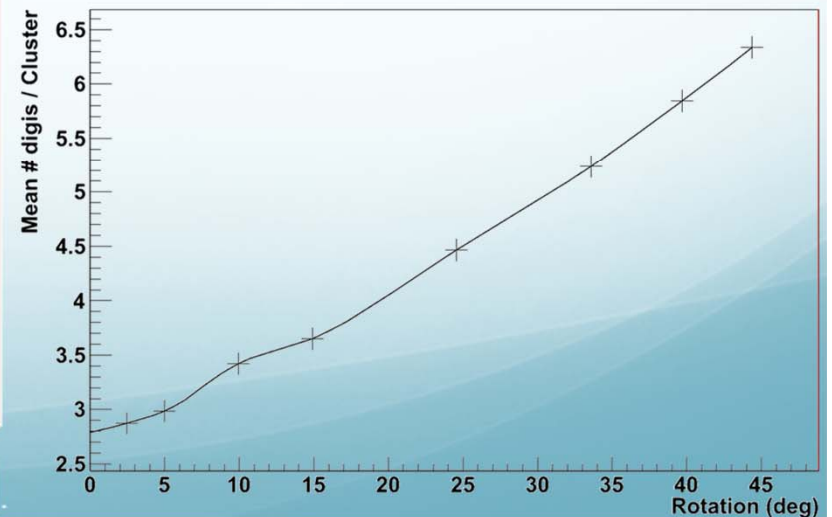

Rotation of One Sensor

4 GeV electrons @ DESY [Hamburg]

Energy loss and cluster size in the rotated sensor

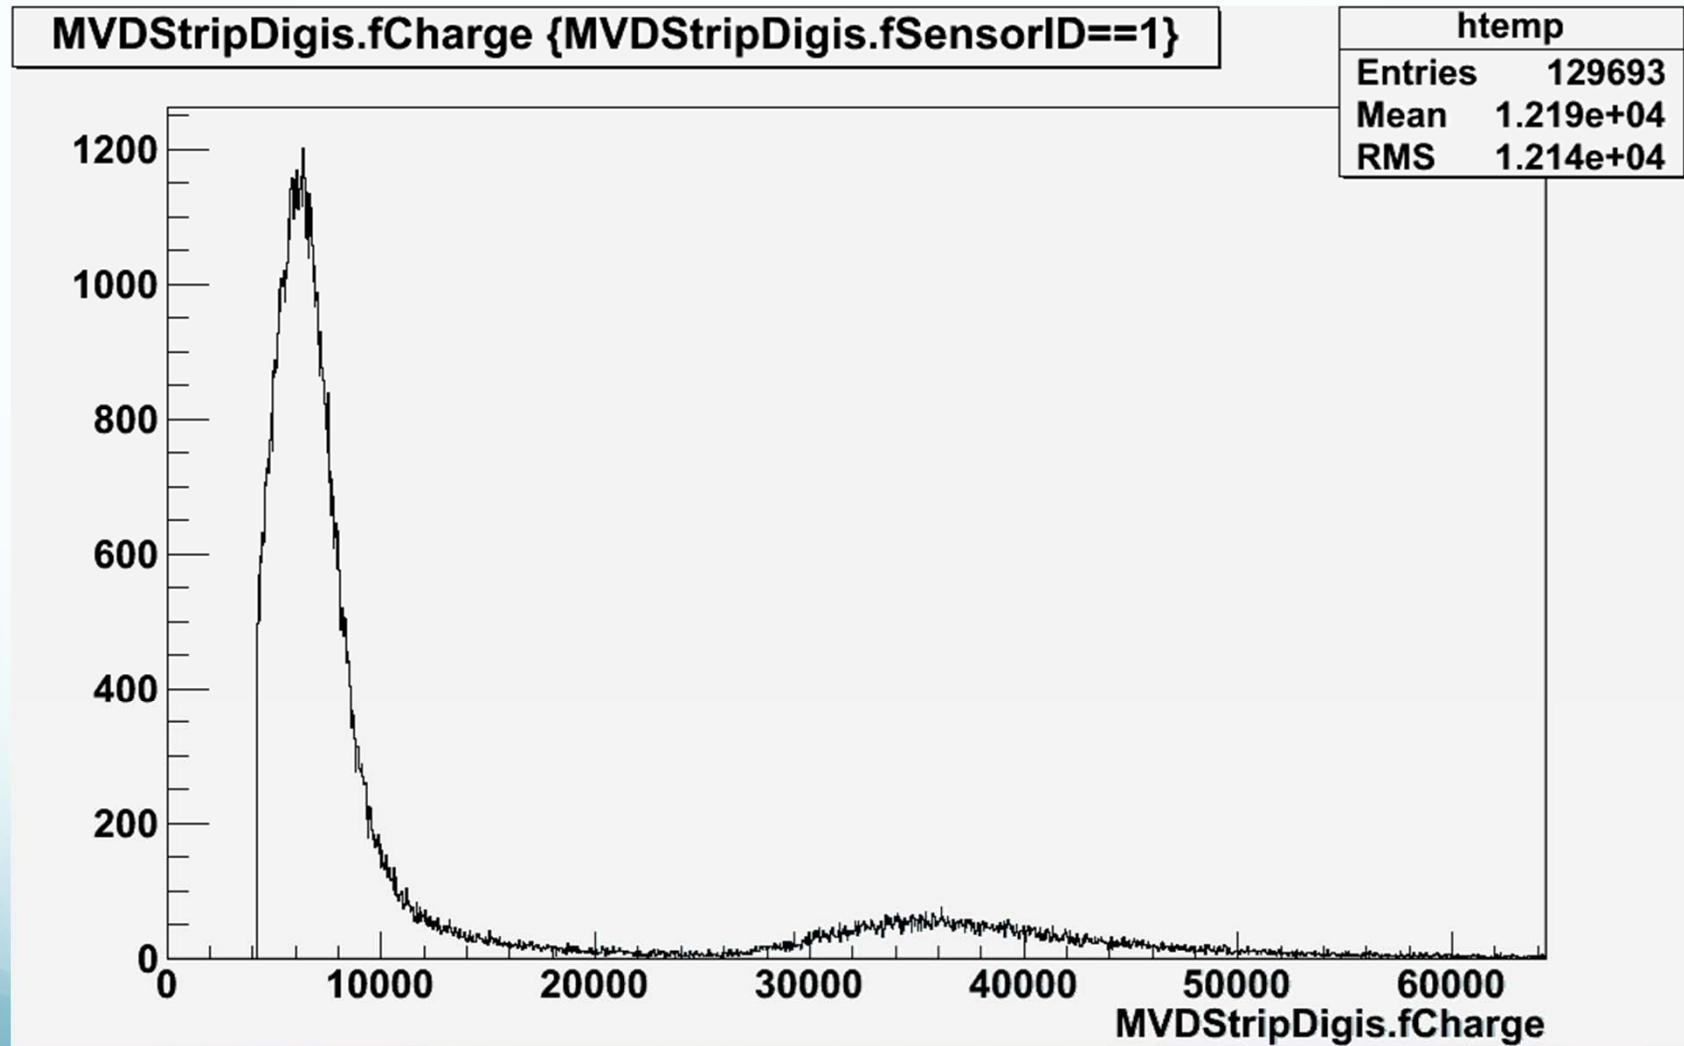

Rotation of One Sensor - Simulations

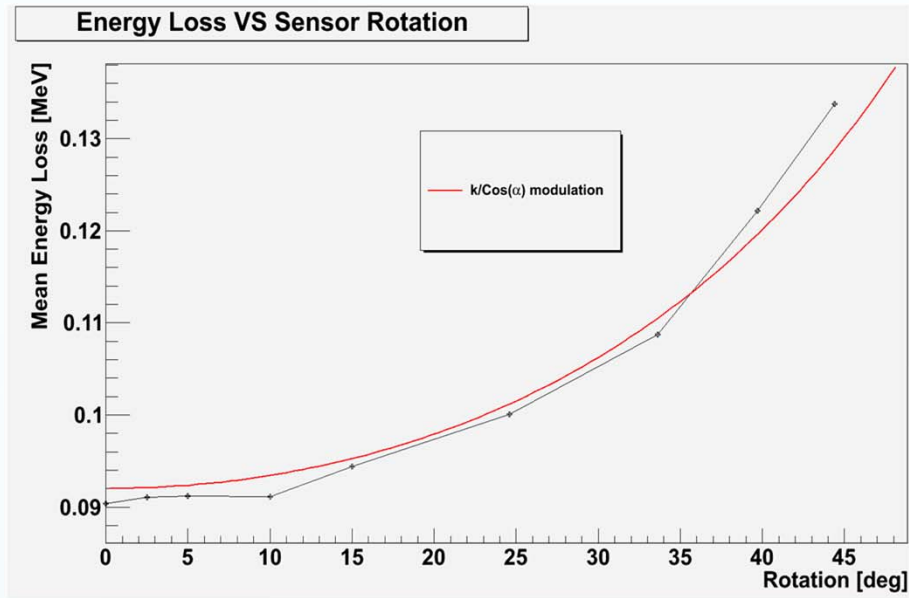

Electrons of 4 GeV - 0 deg rotation

Rotation of One Sensor - Simulations

Electrons of 4 GeV - 44.4 deg rotation

Rotation of One Sensor - Simulations

Electrons of 4 GeV

Translation of One Sensor

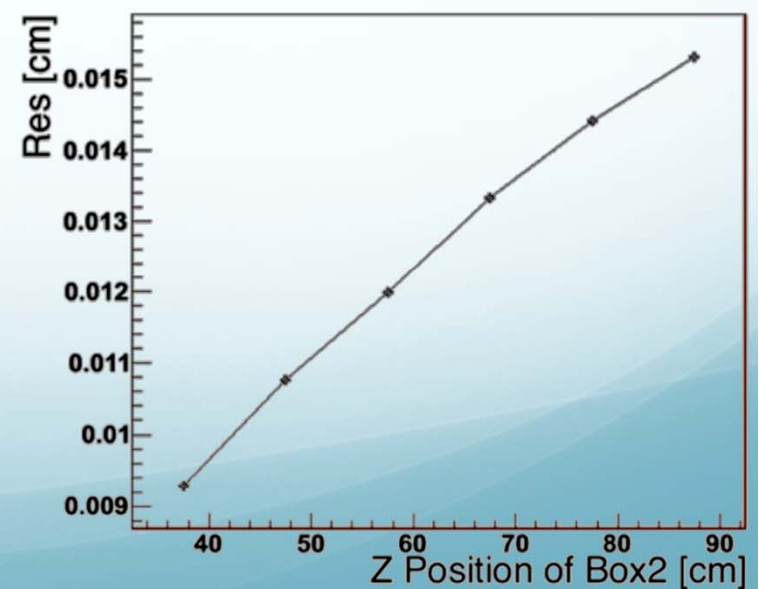

3 GeV electrons @ DESY [Hamburg]

Defining the following estimator: $RES = \sqrt[4]{\sigma_1 * \sigma_2 * \sigma_3 * \sigma_4}$
