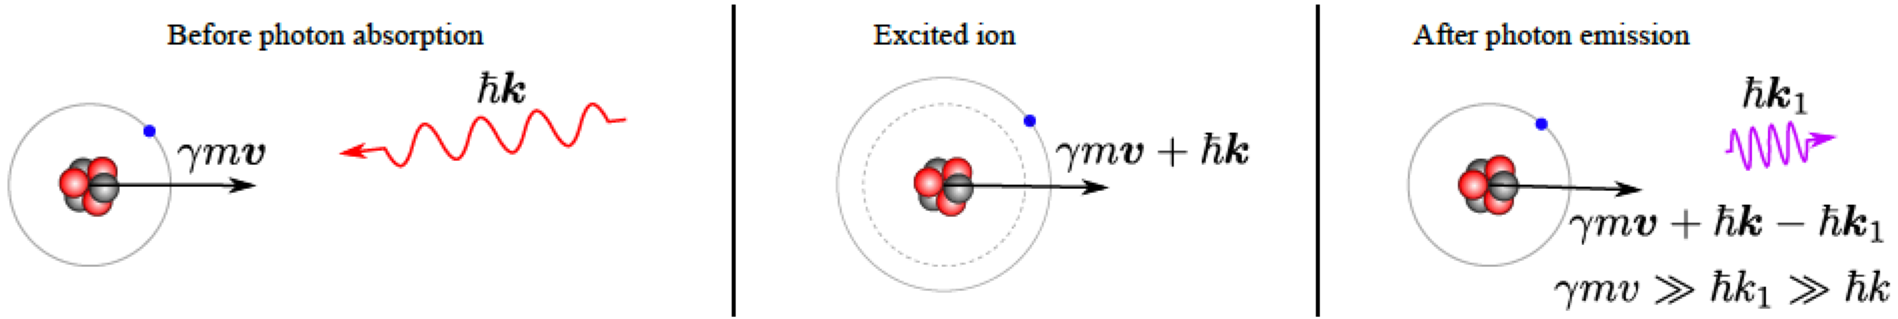
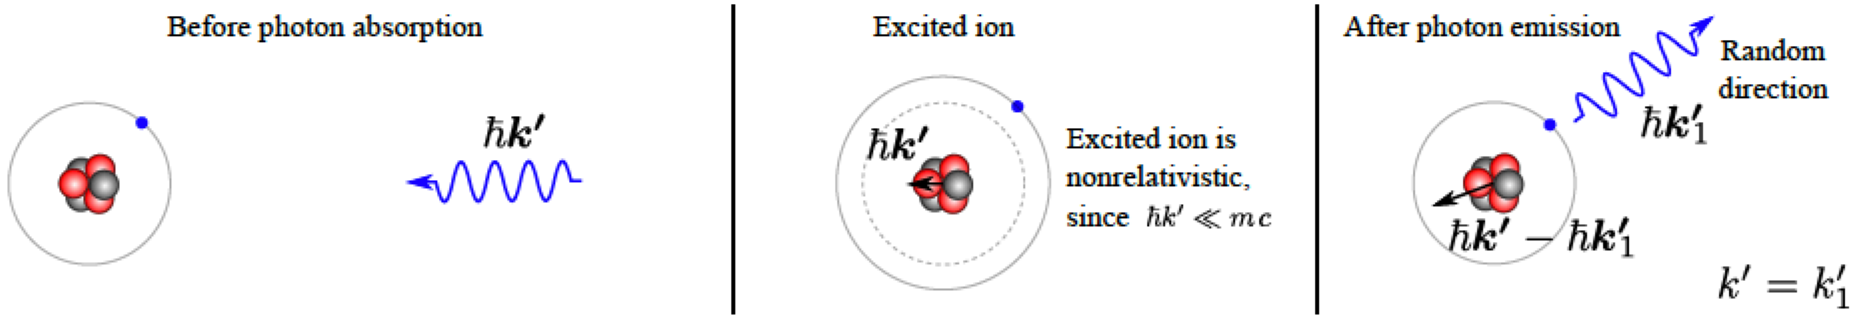
Photon scattering on relativistic ions

In the laboratory reference frame:



Photon-energy boost: $2\gamma_L \times 2\gamma_L$
backward emission angle: $1/\gamma_L$

In the initial ion reference frame:



Photon-energy boost: $2\gamma_L$

Gamma Factory @ CERN

Partially Stripped Ion beam as a light frequency converter

$$\nu^{max} \longrightarrow (4\,\gamma_L^{\,2})\;\nu_i$$

Tuning of the beam energy, the choice of the ion type, the number of left electrons and of the laser type allows to tune the γ-ray energy, at CERN, in the energy domain of 100 keV – 400 MeV.

Example (maximal energy):

LHC, Pb^{80+} *ion*, $\gamma_L = 2887$, n=1→2, $\lambda = 104.4$ nm, E_γ(max) = 396 MeV

The expected magnitude of the γ-source intensity leap

Electrons:	Partially Stripped Ions:
$\sigma_e = 8\pi/3 \times r_e^2$	$\sigma_{res} = \lambda_{res}^2/2\pi$
r_e - classical electron radius	λ_{res} - photon wavelength in the ion rest frame

Electrons:	Partially Stripped Ions:
$\sigma_e = 6.6 \times 10^{-25}$ cm^2	$\sigma_{res} = 5.9 \times 10^{-16}$ cm^2

Numerical example: λ_{laser} = 1540 nm

~ ***9 orders of magnitude difference in the cross-section***

~ ***7 orders of magnitude increase of gamma fluxes***

Is this possible?

A major news from CERN! (July 2018)

During a special one-day run, LHC operators injected lead "atoms" containing a single electron into the machine (Image: Maximilien Brice/Julien Ordan/CERN)

Protons might be the Large Hadron Collider's bread and butter, but that doesn't mean it can't crave more exotic tastes from time to time. On Wednesday, 25 July, for the very first time, operators injected not just atomic nuclei but lead "atoms" containing a single electron into the LHC. This was one of the first proof-of-principle tests for a new idea called the Gamma Factory, part of CERN's Physics Beyond Colliders project.

Nuclear physics at the GF

- Physics opportunities with primary, secondary and tertiary beams
  with previously unattainable parameters
- Direct measurements of astrophysical S-factors at relevant energies
- Spectroscopy of nuclear gamma transitions
  on par with laser spectroscopy of atoms
- Gamma polarimetry at the 10^{-5} to 10^{-6} rad level
- Precision measurement of parity violation in hadronic and nuclear system
  at previously inaccessible asymmetry
- Production of high-intensity, monoenergetic and small-emittance
  tertiary beams: neutrons, muons, neutrinos, etc.
- …

Nuclear physics at the GF: examples

- Direct nuclear-transition spectroscopy of stored nuclei (or PSI)
- Interplay of atomic and nuclear d.o.f.
- (γ, π) reactions to probe halo nuclei
- Photoproduction of pionic atoms,

  e.g., $\gamma + {}^3\mathrm{H} \to ({}^3\mathrm{He} + \pi^-)_{ns}$
