

Dielectron group write-up

Topics

- Thermal and pre-equilibrium dielectrons from *low* to high masses
- Chiral symmetry restoration
Mass below about $1.3 \text{ GeV}/c^2$ with rho spectral function
- Electrical conductivity of the medium
Very low mass and pair transverse momentum

Theory motivations

Thermal and pre-equilibrium dielectrons from low to high masses

Different approaches:

(below those who provided calculations for ALICE 3 LoI & in the RRTF)

- **Expanding fireball model with hadronic many-body theory**
from Ralf Rapp et al. (Hendrik van Hees here) (yield until now)
R. Rapp, Adv. High Energy Phys. 2013 (2013) 148253
P.M Hohler and R. Rapp, Phys. Lett. B 731 (2014) 103
- **Thermal radiation from hadron-gas and QGP + decays** (yield and v2)
from Gojko Vujanovic et al (arxiv:1903.05078 and arxiv:1702.02941)
- **Pre-equilibrium and thermal radiation from QGP** (yield)
from M. Coquet X. Du J-Y Ollitrault S. Schlichting M. Winn
Physics Letters B Volume 821, 10 October 2021, 136626, arXiv:2112.13876

Physics performances

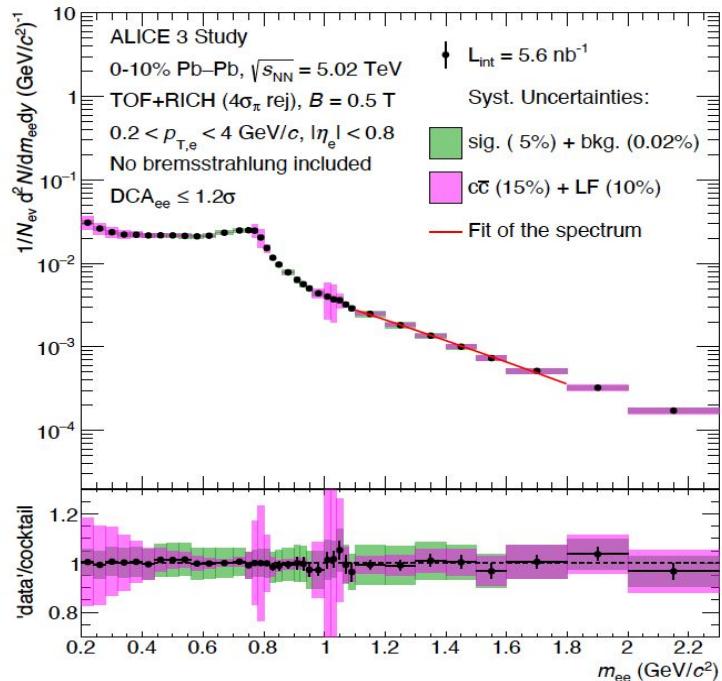

Average temperature extraction

Chiral symmetry

Elliptic flow

ALICE 3 Lol performance plots done:

- With $B = 0.5$ T
- At mid-rapidity
- Using outer-TOF and RICH detector
- **Minimum p_T of 80 MeV/c**
for combinatorial rejection
- Assumed only cold-nuclear matter effects
for Heavy-flavour background

Theory motivations

Thermal and pre-equilibrium dielectrons from low and high masses

- **Measure averaged temperature of the early system**
(thermal radiation as a function of mass, R. Ralf et al., Hendrik van Hees)
- **Measure effective temperature (m_T spectra) and extract information of early eta/s**
(pre-equilibrium calculations S. Schlichting et al. arXiv:2112.13876)
- **Measure elliptic flow of thermal radiation (HG & QGP) and study flow formation**
(Gjoko Vujanovic et al calculations)

*Question we had: how to disentangle different models
differential measurements crucial*

Possible candidates
who could contribute

Theory motivations

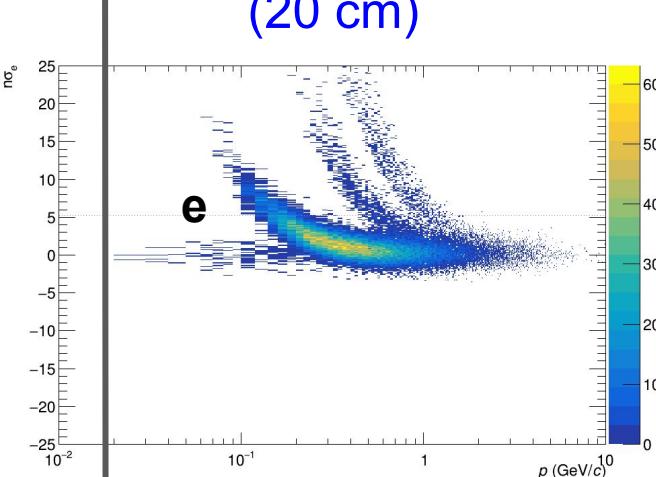

Chiral symmetry restoration

Any updates and/or motivation (Ralf Rapp, Hendrik van Hees)

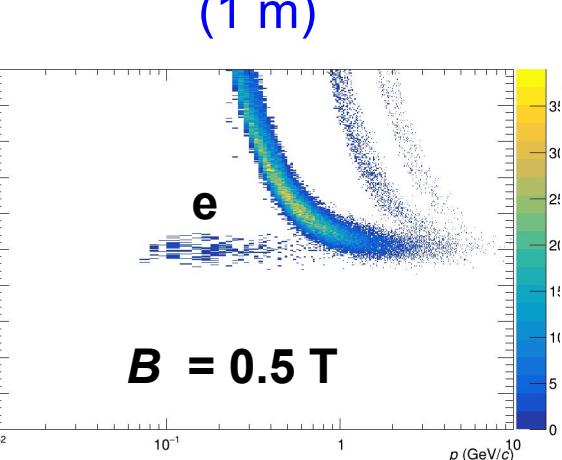

Physics performances

On going: include inner TOF detector to identify electrons

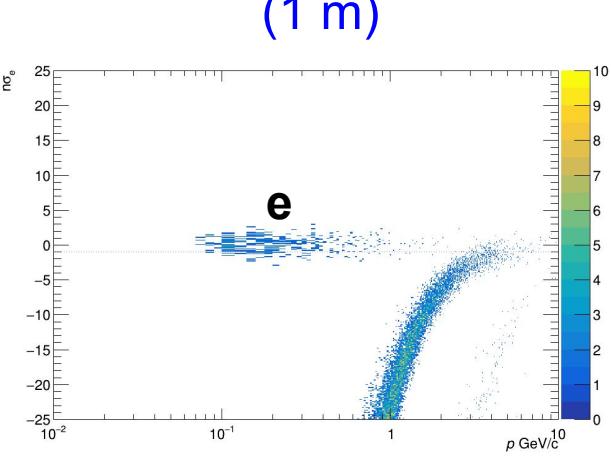

Signal in inner TOF
(20 cm)

Signal in outer TOF
(1 m)

Signal in RICH
(1 m)

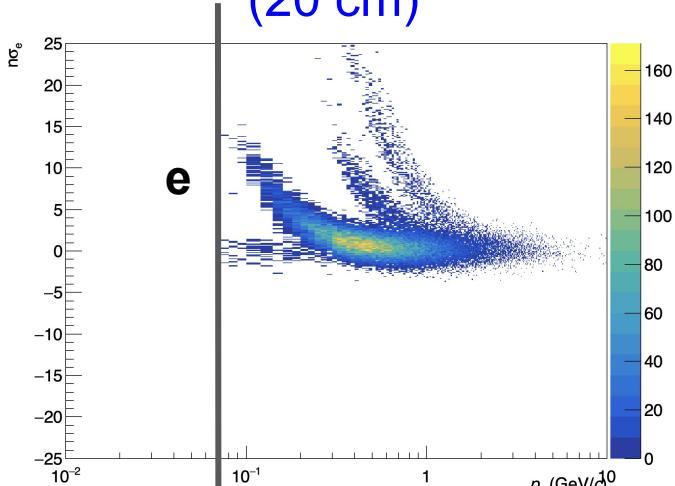

15-20 MeV in p_T \rightarrow can go to lower p_T

Physics performances

On going: and check then performance with higher B field

Signal in inner TOF
(20 cm)

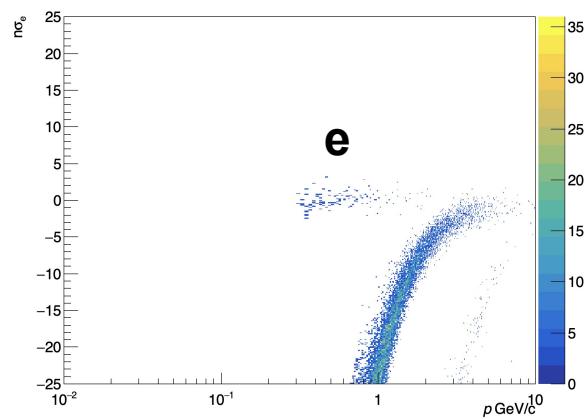

Signal in outer TOF
(1 m)

$$B = 2 \text{ T}$$

60-70 MeV in p_T for $B = 2 \text{ T}$

Signal in RICH
(1 m)

Physics performances

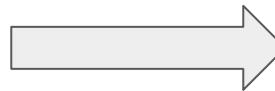

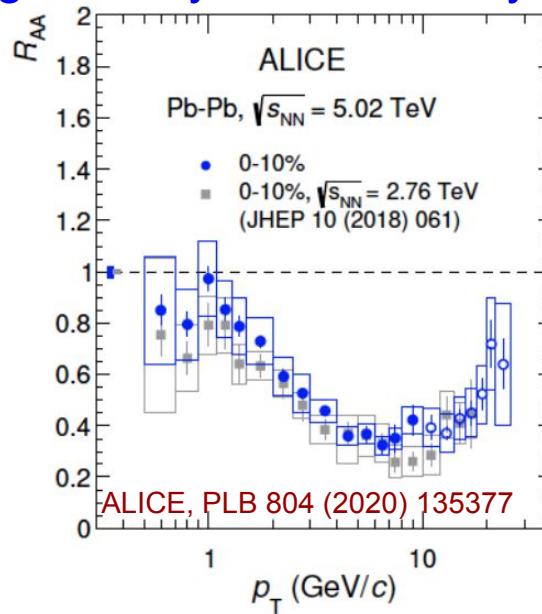

On going: and check then performance with higher B field

- With $B = 2$ (1.5, 1) T
- Using inner-TOF, outer-TOF and RICH detector
- Minimum p_T of 60 (45, 40) MeV/c for combinatorial rejection
- **Check tracking efficiency/mismatch**
- Better m_{ee} resolution expected

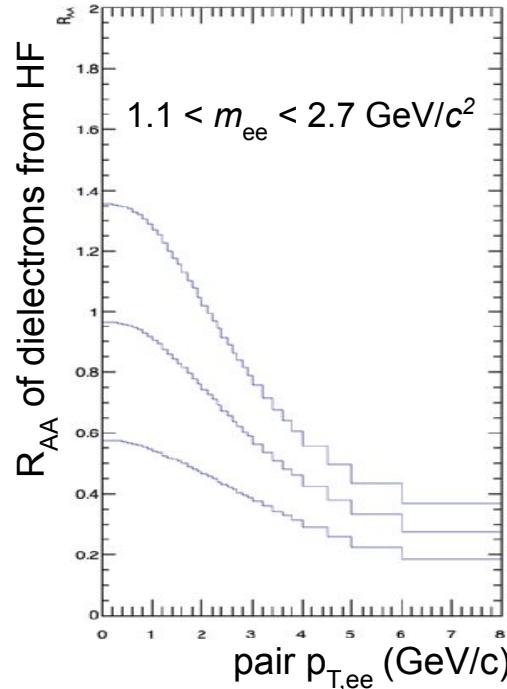

Physics performances

On going: update the background from heavy-flavour hadron decays

Single heavy-flavour decay electrons

Using weights

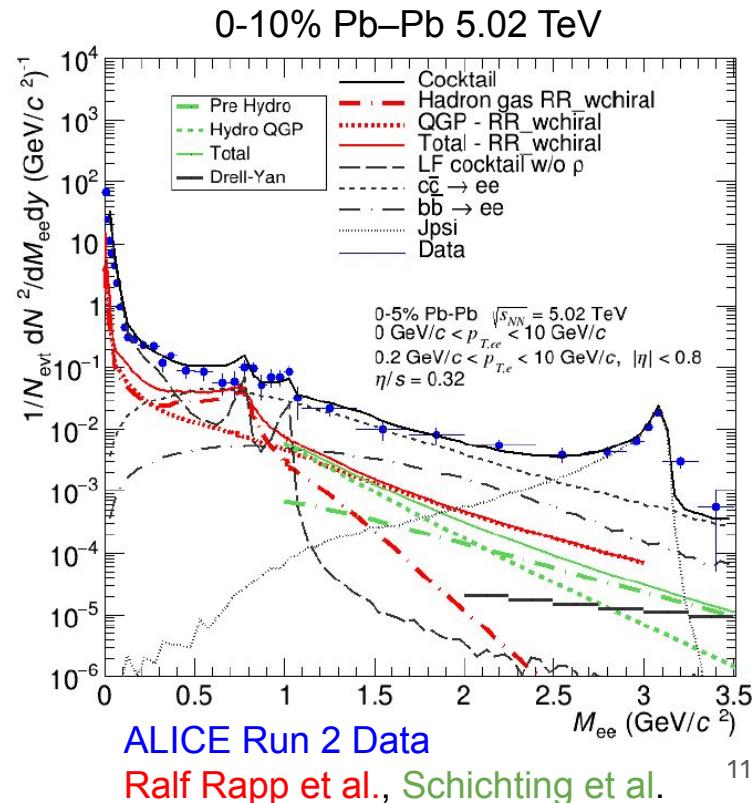

Expect reduced heavy-flavour background at high ptee

Physics performances

More:

- Check calorimeter implementation
 - Response
 - Track propagation
- Check possibilities at forward-rapidity
- ALICE 3 specific: *de-scoping* document
- Use different models as signal:
 - Until now **Ralf Rapp**
 - Compare to **Schichting** calculations

Electrical conductivity

- Physics motivation (Stefan Floerchinger)
- Compare:
 - Signal (Stefan Floerchinger)
 - Hadronic cocktail (Klaus Reygers, Sebastian Scheid, Raphaelle Bailhache)
 - Physics background form UPC (Kai Schweda, Georgijs Skorodumovs)
 - Combinatorial background with inner TOF and $B = 0.2$ T (possible bachelor student, Sebastian, Raphaelle depending on the outcome of above)

*Many points still not 100% clear
Look challenging*

More physics topics

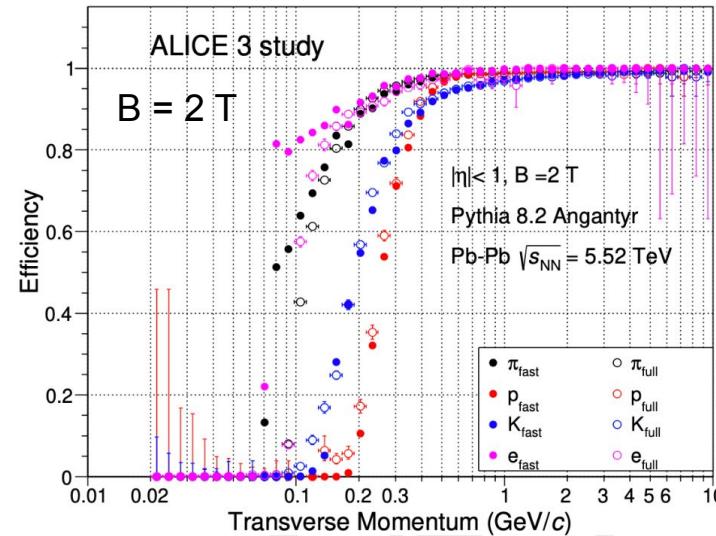

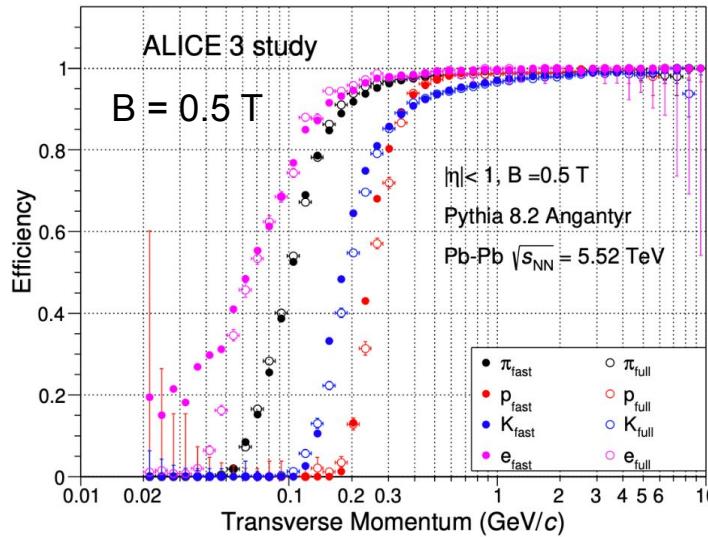

- Dark photons
- UPCs

Back-up

Physics performances
