LOI submitted in Sept.2021

abstract

Although the EMC effect indicates that structure of baryons in nuclear matter is modified from that in the free space, no clear evidence for baryon modification in matter has been found in low energy nuclear phenomena and detailed mechanism of the modification is not understood yet. In order to challenge this problem, we propose to measure the beta-decay rate of a Λ hyperon in a nucleus. The hyperon beta-decay rate can be significantly reduced in a nucleus, if an u (and d) quark wave functions is more spread due to meson field in a nucleus than an s quark wave function, which reduces overlap between u and s quark wavefunctions in the beta-decay. The quark-meson-coupling (QMC) model predicts reduction of the Λ 's beta-decay rate by 20% at maximum.

We will measure the beta-decay rate of ${}^5_{\Lambda}\text{He}$ in 4.5% accuracy. In large nuclei, neutron beta-decay rate is greatly suppressed due to nuclear many-body effects and meson-exchange-current effects. To avoid such “ g_A quenching” effects we chose ${}^5_{\Lambda}\text{He}$ hypernucleus.

The experiment will be carried out at the K1.1 beam line by employing the ${}^6\text{Li}(\pi^+, K^+){}^5_{\Lambda}\text{He}+p$ reaction with the SKS spectrometer. The branching ratio of the beta-decay will be determined in

Contents

- 1. Introduction -- baryon modification in a nucleus**
- 2. Beta-decay of Λ in nuclei**
- 3. g_A quenching effects**
- 4. Proposed experiment**
- 5. Background suppression in BR measurement**
- 6. Lifetime measurement**
- 7. Theoretical calculations**
- 8. Summary**

***It is a rough and premature experimental proposal.
Please give me your advice and critical comments.***

1. Introduction

The hierarchies of quarks, nucleons, and nuclei are really well separated?

- Low energy nuclear phenomena seem to be well described in terms of nucleons (+ nuclear force), where inner structure of nucleons is assumed to be unchanged. (=Without using the word “quarks”.)
- Size of a nucleon ($r \sim 0.8$ fm) and inter-nucleon distance in nuclear matter ($r \sim 2$ fm) are of the same order. Also the same as the pion range (~ 1.4 fm), thus in a nucleus the space is full of meson field.

=> **How rigid is the identity of nucleons in nuclei?**

=> Investigate modification of nucleons in nuclear matter.

=> **Phenomenological parts of nuclear force (the short range part) effectively include effects of the lower (quark) hierarchy.**

=> Understand nuclear force (BB forces) from quark level.

“Modifications” of baryons in nuclear matter

■ EMC effect (Change of structure function in DIS)

- Experimentally established but not well understood.
- Short Range Correlation data at JLab give suggestions.

- What are the good probes sensitive to “baryon modification” in low energy phenomena ? Modification of N in a nucleus often comes from valence nucleons located at a low density region.

**Hyperons are free from Pauli blocking from nucleons
-> They can stay in the 0s orbit => a suitable probe**

- How to discriminate between “baryon modification” and hadronic effects (meson exchange current, baryon mixing...) as well as nuclear many-body effects?

Need to study with various baryons (N, Λ , Σ , ..) in various environment

■ Nucleon swelling?

- Various experimental and theoretical suggestions/conjectures but no clear evidence

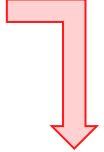

TABLE I. The magnitudes of nucleon swelling inferred from experiments and predicted from various models.

Experiment/model	Size of nucleon swelling
Quasielastic scattering [49]	<3–6% for ^3He
K^+ -nucleus scattering [50]	10–30% for ^{12}C and ^{40}Ca
nIMParton [20]	2.0–8.1% for ^3He - ^{208}Pb
QMC [48]	5.5% for typical nuclei
Binding potential [54]	A few % for typical nuclei
Skymion model [55]	3–4%
Quark- N interaction [56]	$\approx 2\%$ for nuclear matter
Chiral quark-soliton [57]	$\approx 2.4\%$ for heavy nuclei
Chiral symmetry [58]	<10% for nuclear matter
N - N overlapping [37]	4.7–22% for ^3He - ^{208}Pb
Weak stretching [59]	4.5–9.4% for ^4He - ^{208}Pb
PLC suppression [60]	1–3%
Statistical model [61]	2.2–5.0% for ^4He - ^{197}Au
Quark-quark correlation [62]	15%
Chiral quark-meson [63]	$\approx 19\%$ for nuclear matter
String model [64]	40%

PRC 99 (2019) 035205

What probe should be used?

- Compare **electro/weak** properties of hyperons in free space and in nuclear matter
 - Magnetic moment of Λ \Rightarrow **On-going** Λ 's spin-flip B(M1) (J-PARC E63)
 - Electromagnetic decay of $\Sigma^0 \rightarrow \Lambda \gamma$ \Rightarrow **Later**
 - Weak decays of Λ 
- Avoid strongly interacting probes – Medium effects are hidden by FSI.
 - ☹ Mesonic weak decay ($\Lambda \rightarrow N\pi$)
 - ☹ Nonmesonic weak decay ($\Lambda N \rightarrow NN$)
 - 😊 Beta decay ($\Lambda \rightarrow p e^- \bar{\nu}^{\text{bar}}$) \Rightarrow **Today's talk**

2. Beta-decay of Λ in nuclear matter

Weak decay of Λ

Λ DECAY MODES	Fraction (Γ_i/Γ)	Confidence level	p (MeV/c)
$p\pi^-$	$(63.9 \pm 0.5) \%$		101
$n\pi^0$	$(35.8 \pm 0.5) \%$		104
$n\gamma$	$(1.75 \pm 0.15) \times 10^{-3}$		162
$p\pi^- \gamma$	[c] $(8.4 \pm 1.4) \times 10^{-4}$		101
$pe^- \bar{\nu}_e$	$(8.32 \pm 0.14) \times 10^{-4}$		163
$p\mu^- \bar{\nu}_\mu$	$(1.57 \pm 0.35) \times 10^{-4}$		131

$$s \rightarrow u e^- \bar{\nu}_e$$

$$g_A/g_V = -1 / 1 \text{ in the quark level}$$

$$\Lambda \rightarrow p e^- \bar{\nu}_e$$

$$g_A/g_V = -0.718 \pm 0.015^{[b]} \text{ due to hadron structure}$$

(... measured from $p e^-$ angular correlation)

Beta decay and axial vector coupling

- $g_V (n \rightarrow p) \doteq 1$ [CVC], $g_V (\Lambda \rightarrow p) \approx 1$ [Ademollo-Gatto theorem (PRL 13 (1964) 264)]
- $g_A/g_V (n \rightarrow p) = -1.2732 \pm 0.0023$ [= F+D for SU(3)_f]
- $g_A/g_V (\Lambda \rightarrow p) = -0.718 \pm 0.015$ [= F+D/3 for SU(3)_f]
- $g_A^*(n \rightarrow p)$ **quenching** in nuclear beta decay (GT quenching) has been a long standing problem.
 - Not clearly understood
 - (1) Nuclear many-body effect
 - (2) Hadronic effect (meson exchange current, Δ excitation, ..)
 - (3) **Quark effect (baryon structure change) ?**
 - => How well can we estimate (1) and (2)?
 - How can we separate (3) from (1) and (2)?
 - But (1) and (2) should be small for light nuclei, say, $^5_{\Lambda}\text{He}$
- g_A^* is important for double beta decay -> Majorana neutrino mass and also for astrophysics

Modification of g_A^Λ due to baryon “swelling” in medium

$\Lambda \rightarrow p e^- \bar{\nu}^{\text{bar}}$ Sensitive to overlap of u and s quark w.f.

In free space

Bag model picture

$$[i\gamma \cdot \partial - m_q - V_c(r)]\psi_q(r) = 0$$

In nuclear medium if u,d quarks are more spread, but s quark is not spread, then

$$[i\gamma \cdot \partial - \underbrace{(m_q - g_\sigma \sigma)}_{m^*} - V_c(r)]\psi_q(r) = 0$$

Less overlap between
s and u quarks

Reduction of beta decay rate
in medium

Prediction by Quark Meson Coupling Model

Lambda beta-decay in-medium

P.A.M. Guichon, A.W. Thomas / Physics Letters B 773 (2017) 332–335

QMC model: u,d quarks couple to σ , ρ , ω fields in a nucleus but s quark does not.

- $m^* = m - g_{q\sigma}\sigma$ and w.f. of u,d quarks in a baryon change due to scalar field σ .
- m^* and w.f. of s quark do not change.

- For $n \rightarrow p$, $g_V^{-1} \propto (m_d^* - m_u^*)^2$
- For $\Lambda \rightarrow p$, $g_V^{-1} \propto (m_s^* - m_u^*)^2 = (m_s - m_u + g_{q\sigma}\sigma)^2$

$g_{q\sigma}$ determined from saturation density via various many-body theoretical treatments

Fig. 1. Relative variation of the axial coupling as a function of density.

Fig. 2. Relative variation of the vector coupling as a function of density for $m_s = 300$ MeV.

Another interesting channel: $\Lambda \rightarrow n \gamma$

Sensitive to overlap of u and s quark w.f.

Experimentally, $g_A^* = -1.27 \rightarrow \sim -1$ for larger A

g_A quenching has been theoretically studied
in terms of MEC, chiral condensate, by many theorists.

$g_A^* = -0.718 \rightarrow ? -1 ??$ for larger A

Change of g_A^* is ~5% for s-shell

$g_A^* / g_{A_{\text{exp}}}$

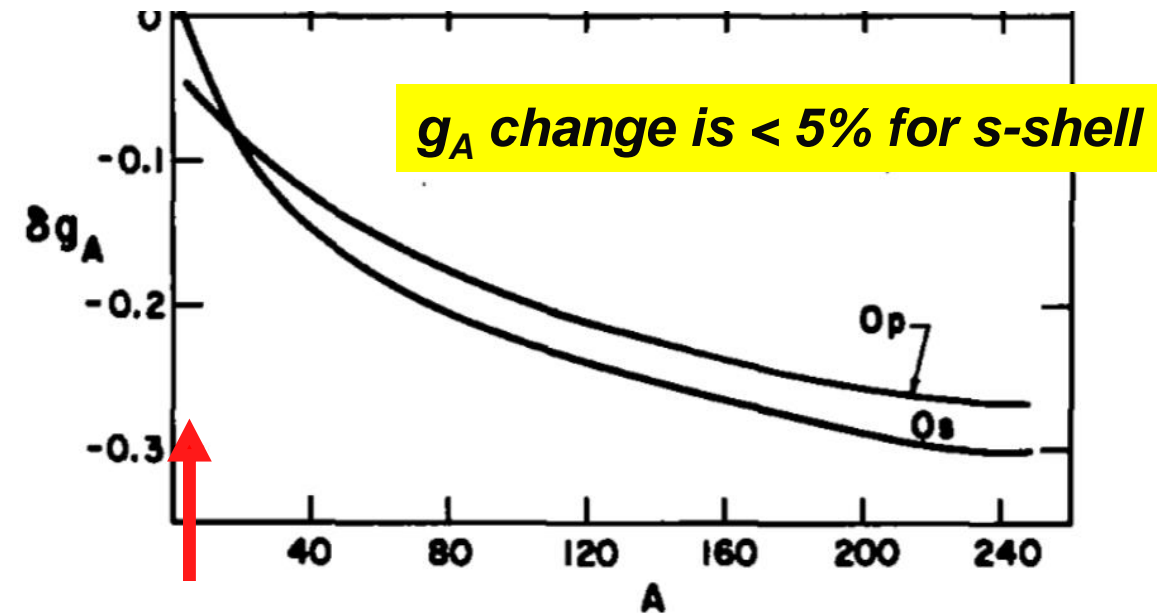

Estimated change of g_A by meson exchange current

4. Proposed experiment

How to measure g_A^Λ in a nucleus?

(1) Branching ratio $BR(\beta)$ and lifetime τ of a hypernucleus

$$\Gamma_\beta = BR(\beta)/\tau \propto (g_V^\Lambda)^2 |\int 1|^2 + (g_A^\Lambda)^2 |\int \sigma|^2$$

$$\text{Free } \Lambda, {}^5_\Lambda\text{He}, {}^{13}_\Lambda\text{C} : \quad = (g_V^\Lambda)^2 + 3 (g_A^\Lambda)^2 \sim 1 + 1.5$$

$$\leftarrow g_V^\Lambda = 1, \quad g_A^\Lambda/g_V^\Lambda = -0.718 \pm 0.015$$

${}^5_\Lambda\text{He}$ case: statistical accuracy of

$$\Delta BR(\beta) \sim 4\% \text{ and } \Delta\tau \sim 2\% \Rightarrow \Delta\Gamma_\beta \sim 4.5\% \Rightarrow \Delta g_A^\Lambda ({}^5_\Lambda\text{He}) \sim 3.7\% \text{ is possible.}$$

\Rightarrow Today's talk

(2) beta-ray asymmetry (angular distribution) $A \rightarrow g_A^\Lambda / g_V^\Lambda$

$n(\pi^+, K^+)\Lambda$ @ 1.1 GeV/c *Pol.* ~ 1.0 But polarization should be known precisely.

${}^5_\Lambda\text{He}$ case: ${}^6\text{Li}(\pi^+, K^+) {}^6_\Lambda\text{Li}, {}^6_\Lambda\text{Li} \rightarrow {}^5_\Lambda\text{He} + p$; ${}^5_\Lambda\text{He}$ polarization unknown.

${}^{13}_\Lambda\text{C}$ case: ${}^{13}\text{C}(\pi^+, K^+) {}^{13}_\Lambda\text{C}$; Polarization (${}^{12}\text{C}$ core pol. effect) can be estimated ?

\Rightarrow Seems difficult

(K^-, π^-) or (π^+, K^+) ?

${}^6\text{Li} (K^-, \pi^-) {}^6_{\Lambda}\text{Li}$

Bertini et al.,

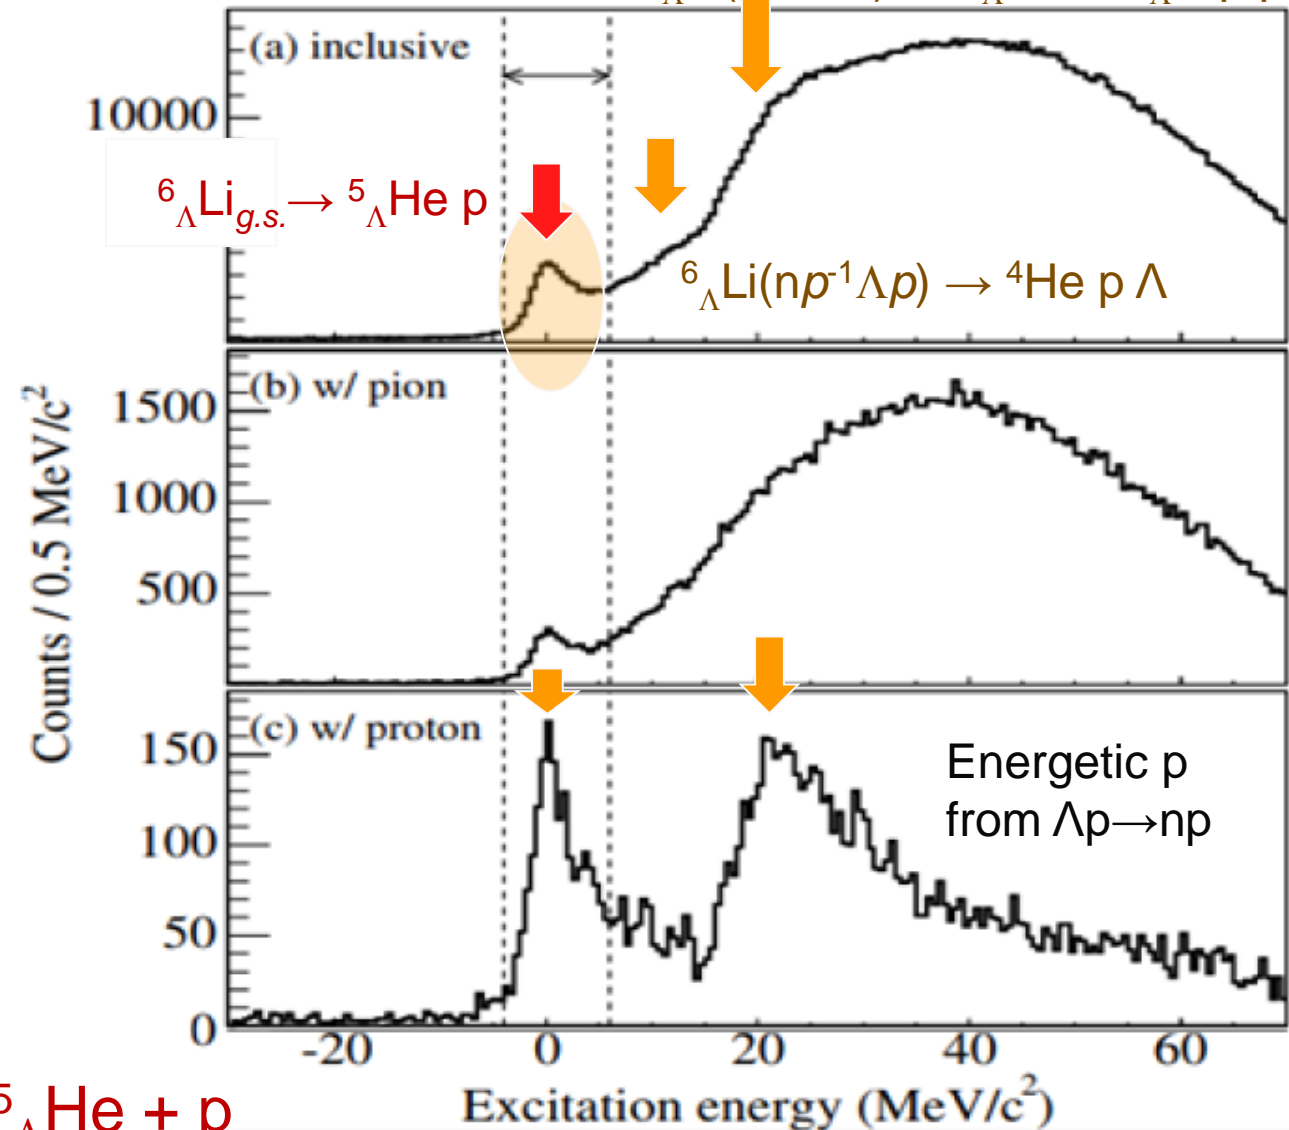

${}^6_{\Lambda}\text{Li}_{g.s.} \rightarrow {}^5_{\Lambda}\text{He} + p$

With a thick ($\sim 20 \text{ g/cm}^2$) target, the $n(p_{1/2}^{-1})\Lambda(p)$ substitutional states will be contaminated in the (K^-, π^-) case.

${}^6\text{Li} (\pi^+, K^+) {}^6_{\Lambda}\text{Li}$

KEK E462

${}^6_{\Lambda}\text{Li}(ns^{-1}\Lambda s) \rightarrow {}^4_{\Lambda}\text{He} d, {}^4_{\Lambda}\text{H} p p, \dots$

${}^5_{\Lambda}\text{He}$ weak decay : one of the best known

5. BR measurement

GEANT4 simulation by K. Kamada and M. Fujita

Tentative parameters (to be optimized later)

- Target: 90%- ${}^6\text{Li}$, $4\text{cm}\phi \times 30\text{cm}$ (14 g/cm^2)
- Calorimeter: BGO
Acceptance: 4π – beam holes ($30+90\text{msr}$)
→ inefficiency of 0.96%
Thickness: 20cm ($18L_R$)
Segmentation: $15(\theta) \times 15(\phi) = 225$
($7\text{cm} \times 7\text{cm} \times 20\text{cm}$ for each crystal)
- Plastic (TH) : $0.5\text{cm} \times 50\text{cm}$
- Lucite Cerenkov (TLC): $0.5\text{cm} \times 50\text{cm}$

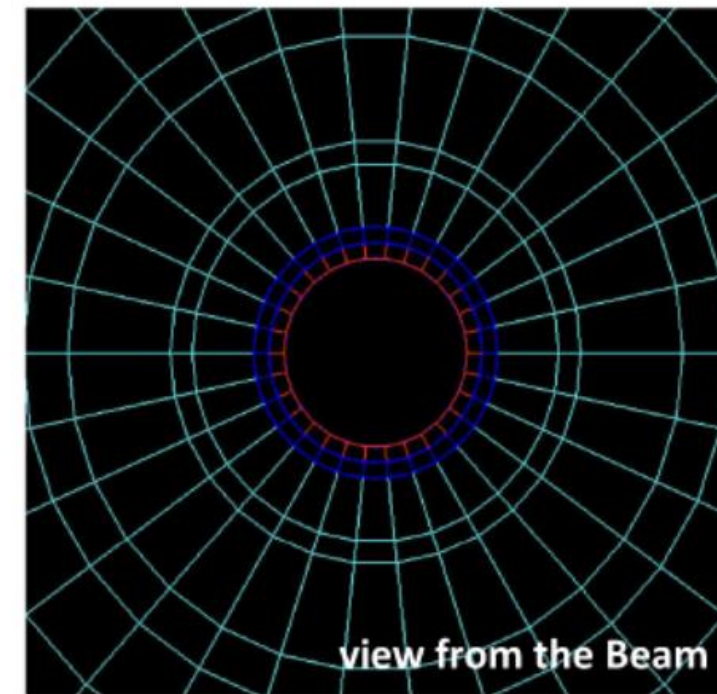

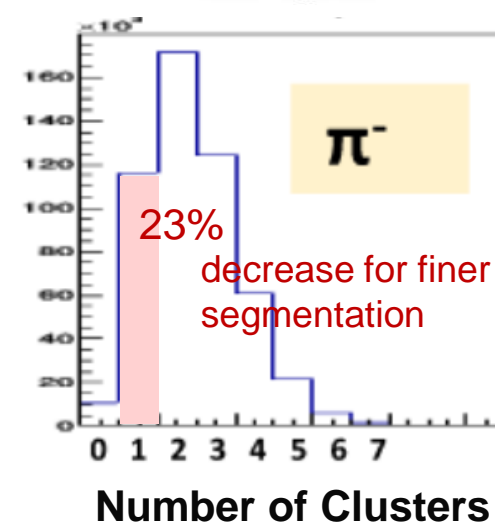

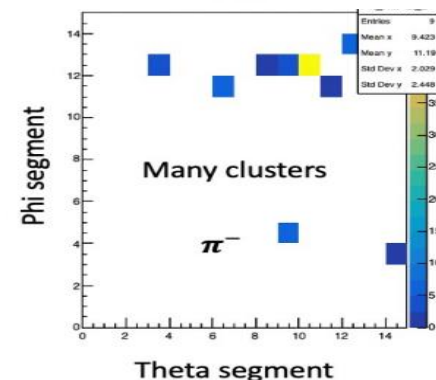

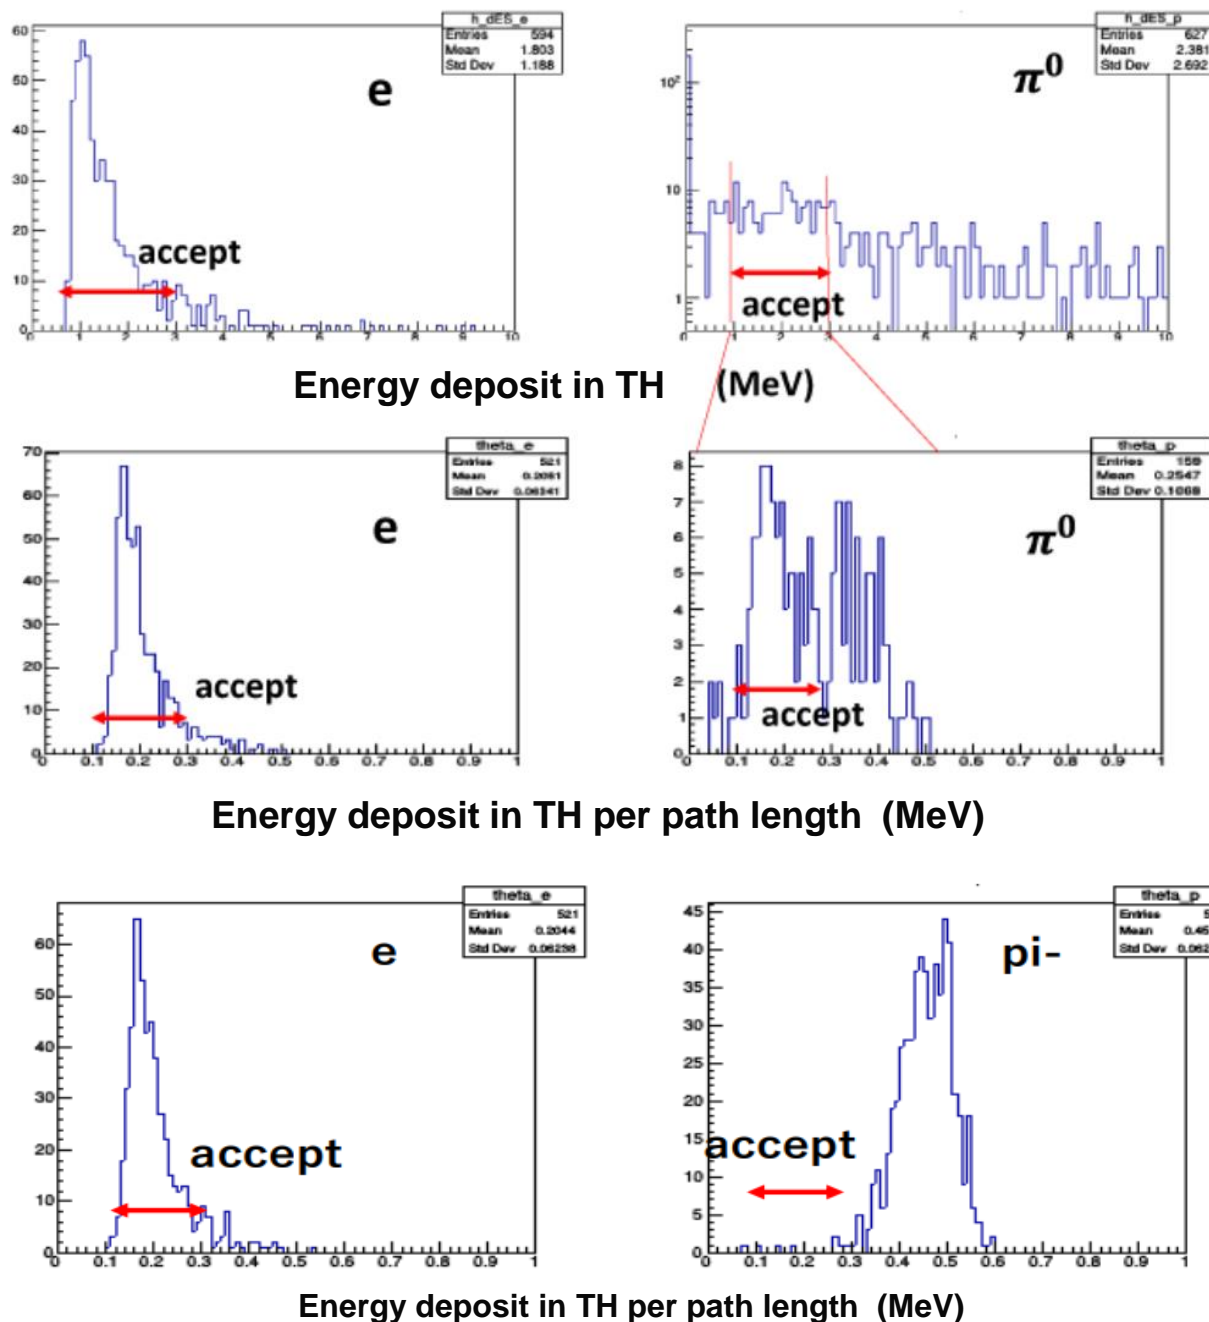

Figure 8: GEANT4 geometry of the setup around the target used in the present simulation

Number of Clusters in BGO

Further selection with ΔE in TH

Background reduction

- $\Lambda \rightarrow n \pi^0$ BR=0.20
 - $\gamma \rightarrow e$ conversion x0.04
 - BGO 1-cluster x0.03
 - TH ΔE /path cut, TH hit position cut x0.29
 - Install photon veto counters around the downstream spectrometer x0.5
 - => BR= 0.35×10^{-4}
 - $\Lambda \rightarrow p \pi^-$ BR=0.40
 - TLC hit x0.045
 - BGO 1 cluster x0.23
 - # of hit segments x0.46
 - TH ΔE /path and hit position cut x0.002
 - => BR= 0.04×10^{-4}
 - $\Lambda p \rightarrow n p, \Lambda n \rightarrow n n$ BR=0.40
 - The same cut as above => BR< 0.04×10^{-4}
- The same cut reduces the beta-ray events to 68%.

Expected beta-ray spectrum

Background/ Signal

$$\begin{aligned} &\approx \text{BR}(\pi^0 \text{ bg}) / 0.68 \text{ BR}(\beta) \\ &= 0.35 \times 10^{-4} / (0.68 \times 8.3 \times 10^{-4}) \\ &= 0.06 \end{aligned}$$

If background level can be experimentally estimated within 30% accuracy,
the systematic error in $\text{BR}(\beta)$ will be $< 2\%$

Figure 11: Simulated spectrum of the beta-ray electron energy (blue) and the contaminated background events (red) after all the background rejection analysis. The number of the background events is 4% of that of the beta-ray electron.

6. Lifetime measurement

Setup around the target for lifetime measurement

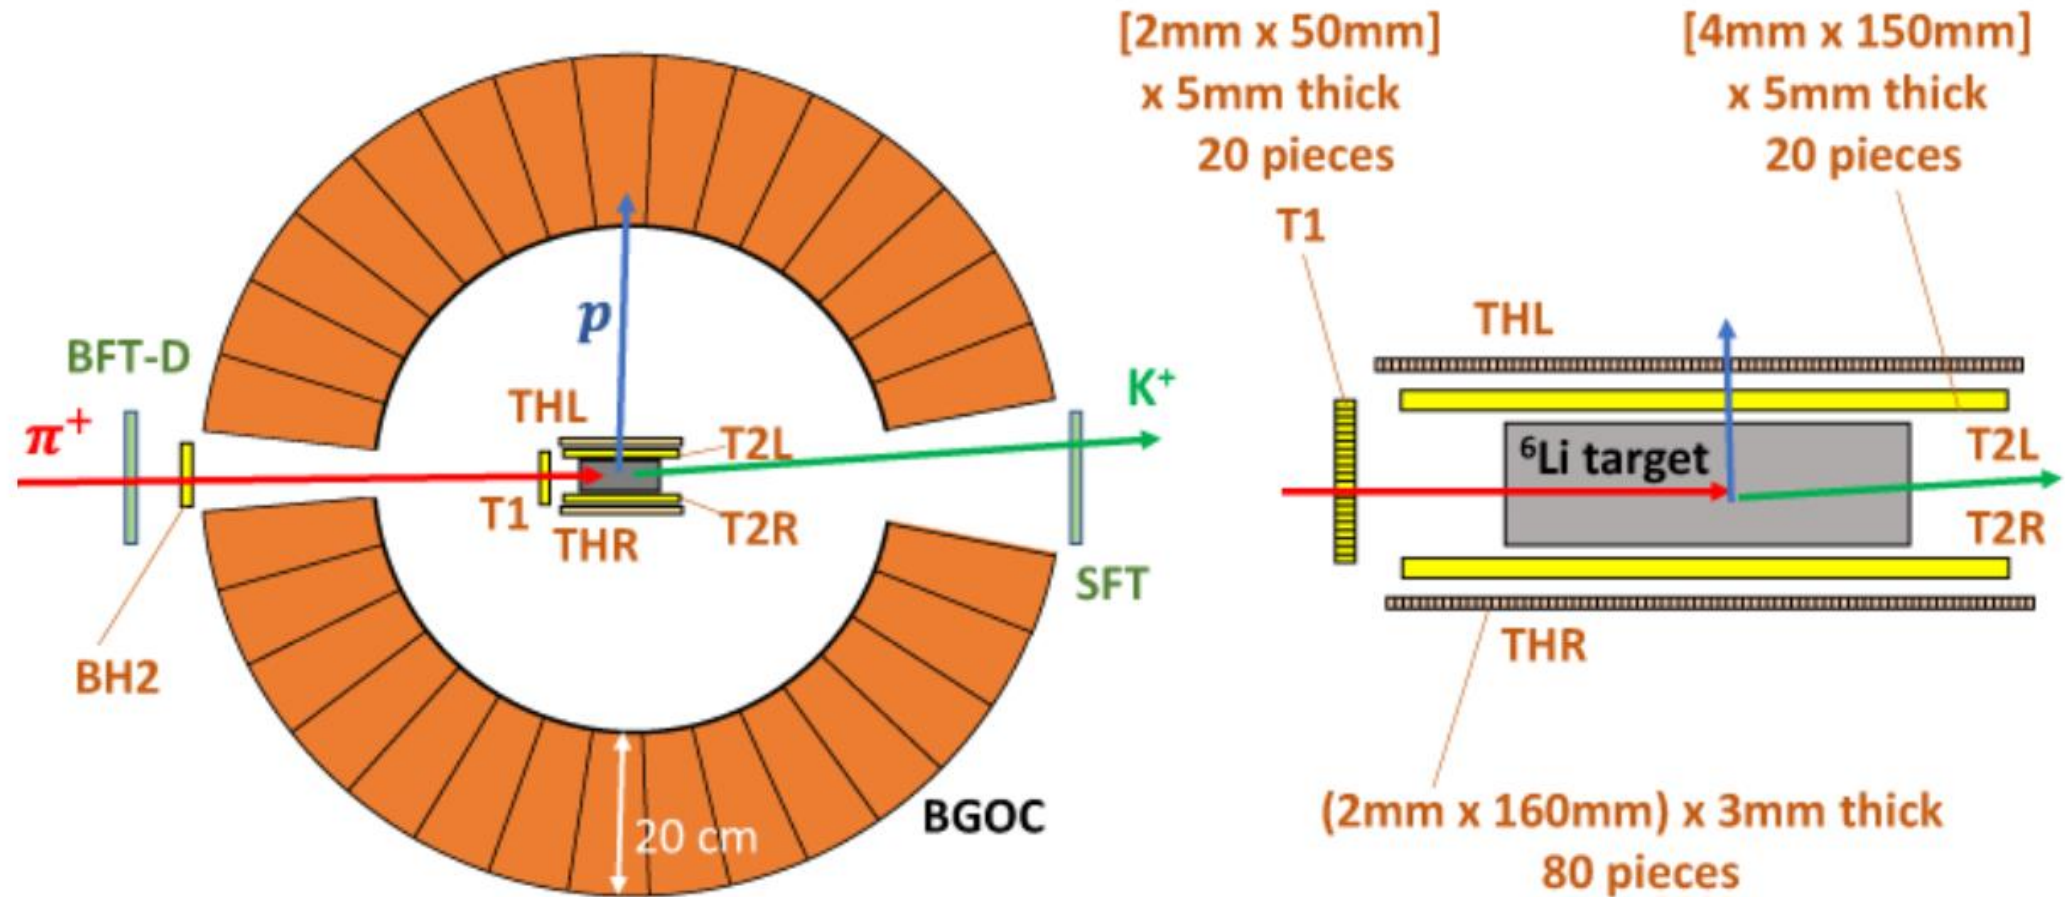

Figure 13: Schematic view of the setup around the target for the lifetime measurement.

${}^5_{\Lambda}$ He lifetime measurement (KEK E462)

E462 setup

Figure 12: Decay time spectra for ${}^5_{\Lambda}\text{He}$ and ${}^{12}_{\Lambda}\text{C}$ measured in KEK E462 experiment. The upper panels show “response function” of the spectrum measured with the prompt reaction of (π^+, pp) , while the lower panels show decay time spectra for ${}^5_{\Lambda}\text{He}$ and ${}^{12}_{\Lambda}\text{C}$ hypernuclei via (π^+, K^+p) reaction.

Yield and statistical error for lifetime

Table 3: Expected yields of the ${}^5_\Lambda\text{He}$ hypernuclei and their nonmesonic proton events, and then the expected lifetime accuracy, are estimated in comparison with the KEK E462 results.

Experiment	E462	Proposed experiment
Number of π^+ beam	2.5×10^{12}	2.5×10^{12}
${}^6\text{Li}$ target thickness	3.70 g/cm ² (80 mm)	4.6 g/cm ² (100 mm)
${}^5_\Lambda\text{He}$ counts after SKS analysis	45653	5.7×10^4
$BR_p[16]$	0.28	0.28
proton detection efficiency	?	0.3
Proton counts	~ 1030	4768
Time resolution (rms)	128 ps	128 ps
Statistical error of lifetime	4.0%	1.9%

$$\Delta BR(\beta) \sim 4\% \text{ and } \Delta\tau \sim 2\% \Rightarrow \Delta\Gamma_\beta \sim 4.5\% \Rightarrow \Delta g_{\Lambda}^\Lambda ({}^5_\Lambda\text{He}) \sim 3.7\%$$

**Measurement of the ${}^5_\Lambda\text{He}$ beta-decay rate
in $\Delta\Gamma_\beta \sim 4.5\%$ ($\Delta g_{\Lambda}^\Lambda \sim 3.7\%$) accuracy seems feasible.**

7. Theoretical calculations

Theoretical calculations for ${}^5_{\Lambda}\text{He}$ (and ${}^{13}_{\Lambda}\text{C}$)?

- Nuclear effects of the daughter proton
 - Precise estimate of Pauli effect incl. ${}^5\text{Li}$ structure
- Hadronic effects
 - Meson exchange current had better be estimated.
- Estimate “quark effects” from the effective density which a daughter proton feels
 - > may not be large for ${}^5_{\Lambda}\text{He}$? ${}^{13}_{\Lambda}\text{C}$ is better?

Fig. 4. The theoretical π^- decay spectrum $\Gamma_{\pi^-}({}^5_{\Lambda}\text{He})/\Gamma_{\pi^-}$ with YNG drawn as a function of the $p\alpha$ relative energy $E_{p\alpha}$ is compared with the observed π^- decay spectrum taken in the emulsion experiment^{18,33}). The calculated π^- decay rate is compared with the experimental values^{12,20}) in table 1 and fig. 5.

Toward understanding the quenching g_A problem

${}^6\text{He} \rightarrow {}^6\text{Li}$ beta decay calculation

S. Vaintraub, N. Barnea, D. Gazit, PRC 79 (2009) 065501

- **Chiral perturbation theory ($N^3\text{LO}$) to determine the axial weak current**
- *Triton beta-decay rate is used to determine the LEC relevant to MEC.*
- *Very small dependence on the cutoff parameter.*
- *Nuclear many-body calculation using Hyperspherical-Harmonics expansion.*

The experimental 9.3% quenching is almost explained without reducing g_A .

TABLE III. The JISP16 NN interaction ${}^6\text{He}$, ${}^6\text{Li}$ binding energies, rms matter radii, and the leading order GT matrix element as a function of K_{max} .

K_{max}	${}^6\text{He}$		${}^6\text{Li}$		GT _{LO}
	B.E.	radius	B.E.	radius	
4	18.367	1.840	19.392	1.859	2.263
6	24.103	1.902	26.124	1.909	2.247
8	26.392	1.979	28.854	1.984	2.234
10	27.560	2.051	30.156	2.051	2.232
12	28.112	2.112	30.797	2.110	2.229
14	28.424	2.165	31.132	2.160	2.227
∞	28.70(13)		31.46(5)		2.225(2)
[21]	28.32(28)		31.00(31)		produced within 3%
Exp.	29.269	2.18	31.995	2.09	2.161

If a similar calculation is done for ${}^5_\Lambda\text{He}$, a measured g_A deviation can be attributed to quark effects.

...But how to measure/estimate LEC is a problem for Λ .

Summary and prospect

- Electro-weak properties of hyperons in hypernuclei are good probes to investigate possible modification of baryons in nuclear matter.
- We propose to measure Λ 's beta decay rate from BR and lifetime.
- Experimentally, measurement with $\sim 4\%$ statistical accuracy is possible for ${}^5_{\Lambda}\text{He}$.
- Simulation shows that huge background can be sufficiently suppressed and **the experiment seems feasible.**

What to do

- More realistic simulation (BGO response by n and γ , include detector resolution, ...)
- Counting rate problem (BGO \rightarrow faster scintillator)
- Optimization of the setup

To theorists:

- Give me your comments. Is this experiment interesting? meaningful?
- Please give us theoretical estimates on
Pauli and nuclear many-body effects, and hadronic (MEC) effects, hopefully via precise few-body calculation.
