

# Aging studies and resulting design change considerations for MRPC2

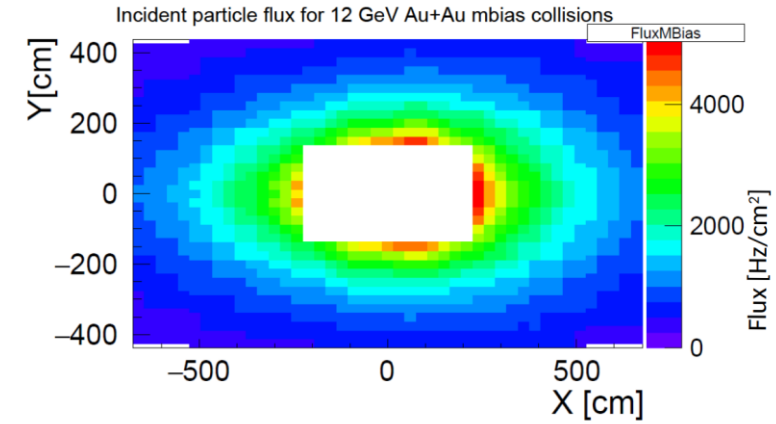

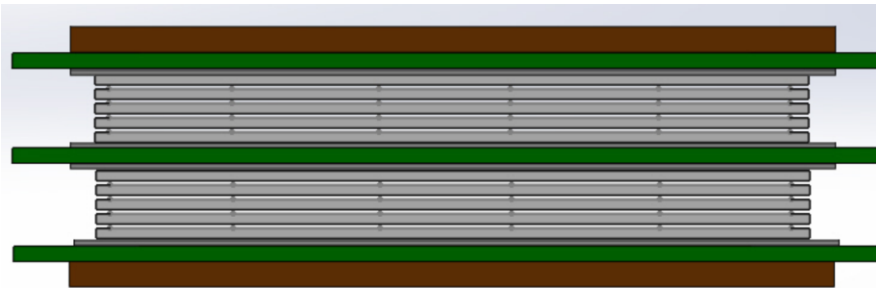

Botan Wang, Yi Wang, Dong Han, Xiaolong Chen, Qiunan Zhang

Tsinghua University

# MRPC2

Parameters of outer wall MRPC	MRPC2
Number of gas gaps	8 (4 in each stack)
Gas gap width	0.25 mm
Thickness of glass electrodes	0.7 mm
Electrodes	Low resistive glass
Rate requirement	5 kHz/cm <sup>2</sup>
Strip length (active)	270 mm
Strip width	7 mm
Strip pitch	10 mm
Strip impedance	50 Ω
Strip number	32
Quantity demand	580

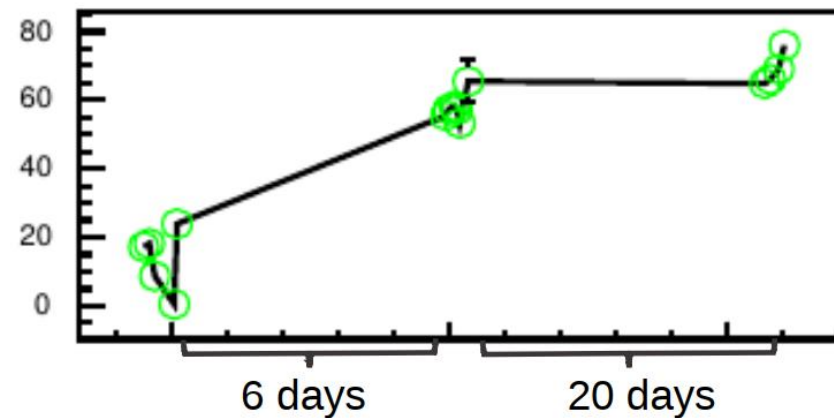

- A module contains several MRPC counters
- ■ Region containing counters equipped with thin float glass,  $\rho \approx 10^{12} \Omega \text{ cm}$
- ■ Region containing counters equipped with low resistivity glass,  $\rho \approx 10^{10} \Omega \text{ cm}$
- ■ Region containing counters equipped with ceramic material  $\rho \approx 10^9 \Omega \text{ cm}$

Ingo Deppner

# Aging effect

Dark rate of MRPC2 at mCBM (Hz/cm<sup>2</sup>)

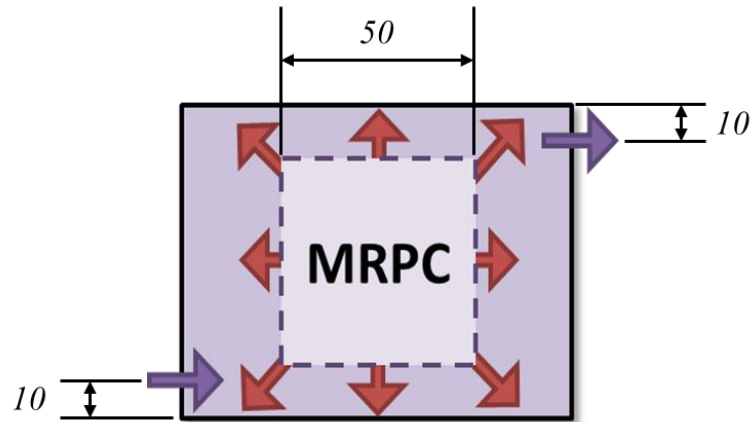

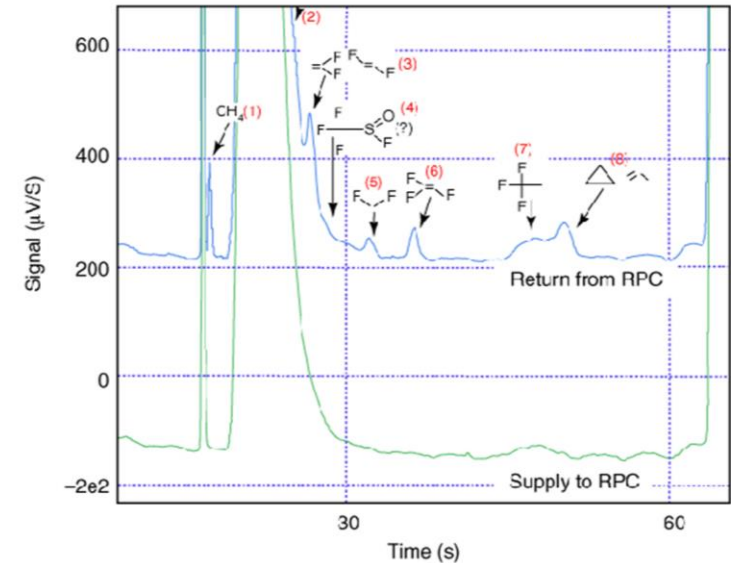

Potential radiation response: increased dark rate(off-spill) compared to cosmic tests( $\sim 1\text{Hz/cm}_2$ ).  
Big difference among counters.  
→Insights into aging effects: gas pollution, glass aging.

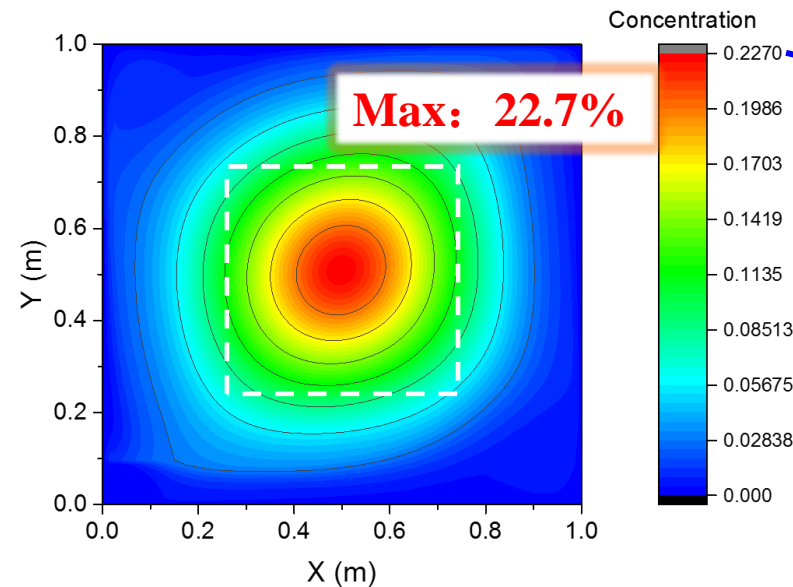

Q. Zhang. 36<sup>th</sup> Collaboration meeting.

# Gas pollution effect

- ✓ The operation of MRPC ionizes the working gas (mainly Freon) and produces pollutants.
- ✓ The current method to supply the gas is through a **gas-streaming box**.
- ✓ With narrow gaps, the mechanism of gas exchange is **diffusion**.
- ✓ Lower volume will help promote the gas exchange.

A simplified gas-streaming model for ANSYS Fluent simulation

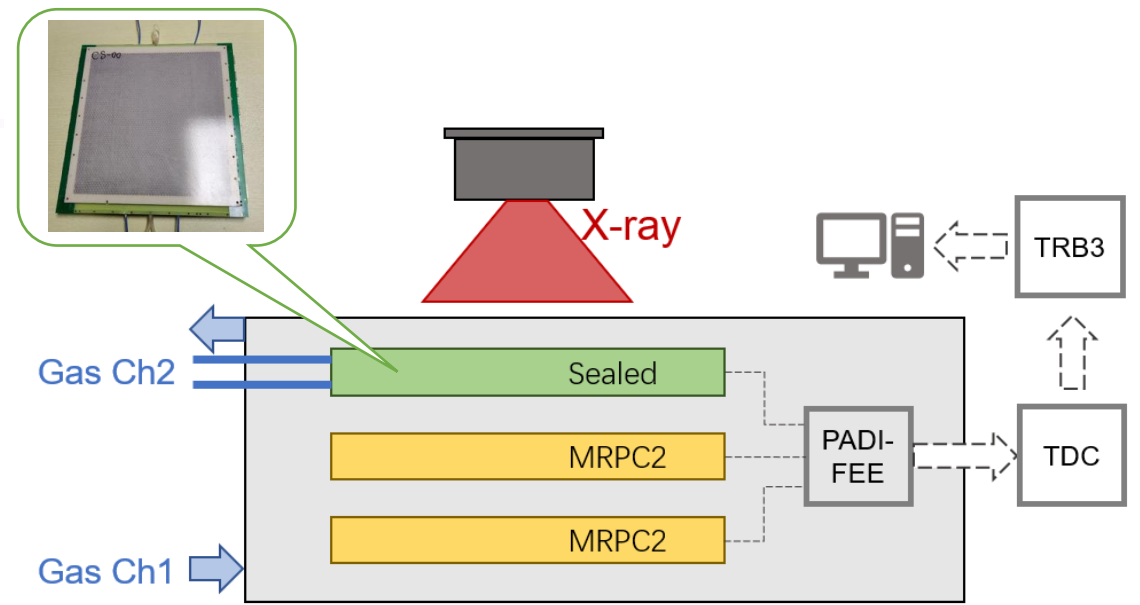

# Gas pollution effect

A 'sealed' MRPC prototype built for a comparative study.

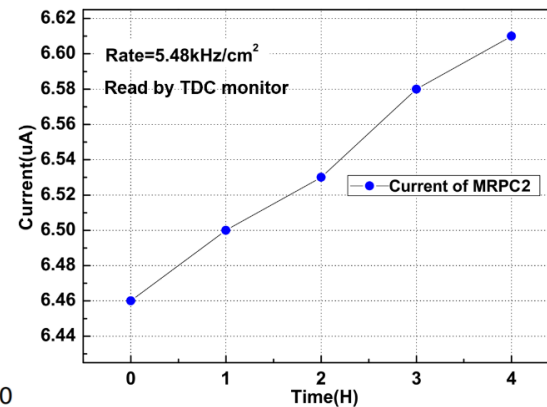

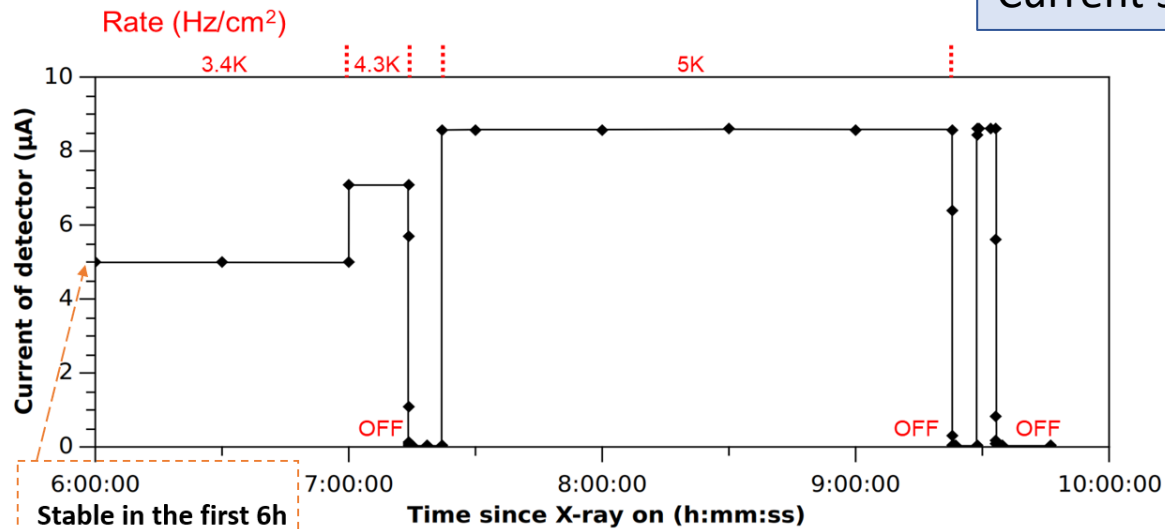

- 200 mL gas volume per counter

X-ray test finds the gas pollution effect:

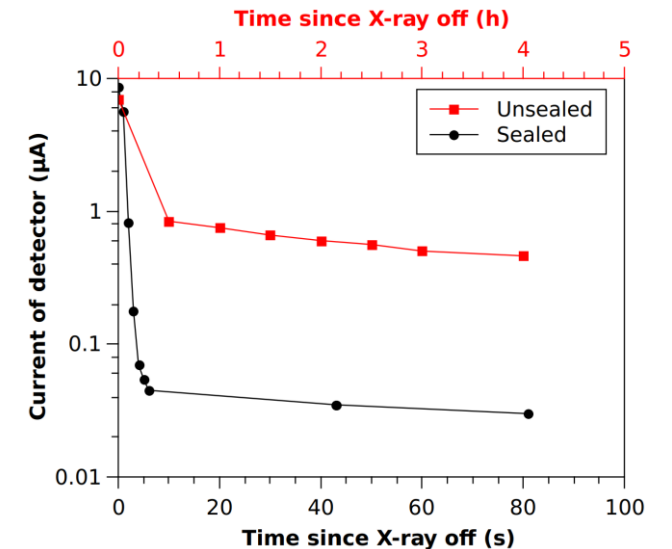

- Current rise in constant flux rate
- Slow exchange of pollutant.

Current stability

Dark current relaxation

# Glass aging study with SEM

## Scanning Electron Microscope

Samples of regions with interest collected from MRPC2-005

圖 2

	wt%	σ
O	33.8	0.3
F	20.7	0.3
Fe	18.9	0.2
Si	14.7	0.1
C	7.1	0.5
Al	4.2	0.1
Na	0.4	0.1
S	0.2	0.0

圖 8

	wt%	σ
F	45.1	0.6
Na	43.2	0.5
C	7.8	0.9
O	2.5	0.2
Fe	0.9	0.2
Si	0.6	0.1

A comparison of fishline region at anode (left) and cathode (right) side.

### Findings:

Damage of glass — crack along the fishline, at sparking spots. The reason why those visible structures cannot be removed.

Na — positive ion, move under electric field, concentrate at fishline

F — found at both sides. High fraction at damaged zones.

Dark current must be controlled in MRPC operation to mitigate the aging effect.

# Performance of the sealed MRPC prototype

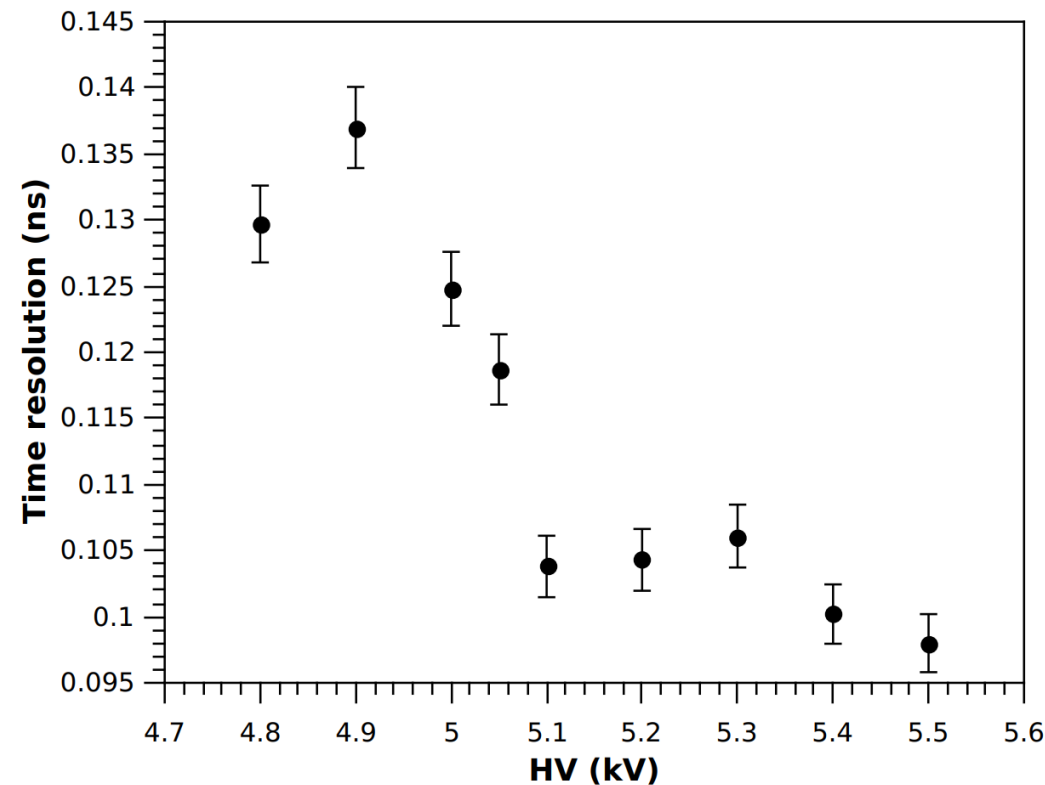

Active area:  
280\*250 cm<sup>2</sup>

Cosmic test with TRB3 system:

The working point and efficiency is the same as the former MRPC2

Time resolution:  $100/\sqrt{2} \sim 70$  ps

# Structure design of sealed MRPC2

- Sealed by frame and PMMA panels
- With full active area:  $330 \times 276 \text{ mm}^2$
- $2 \times 4$  gas gaps
- 32 strips with  $7 + 3 \text{ mm}$  interval, 27 cm length

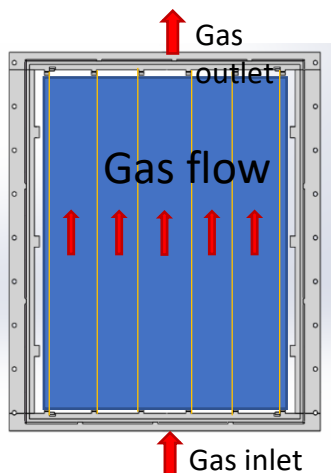

Dimension:  $338 \times 385 \times 30 \text{ mm}^3$   
Former MRPC2:  $338 \times 360 \times 26 \text{ mm}^3$

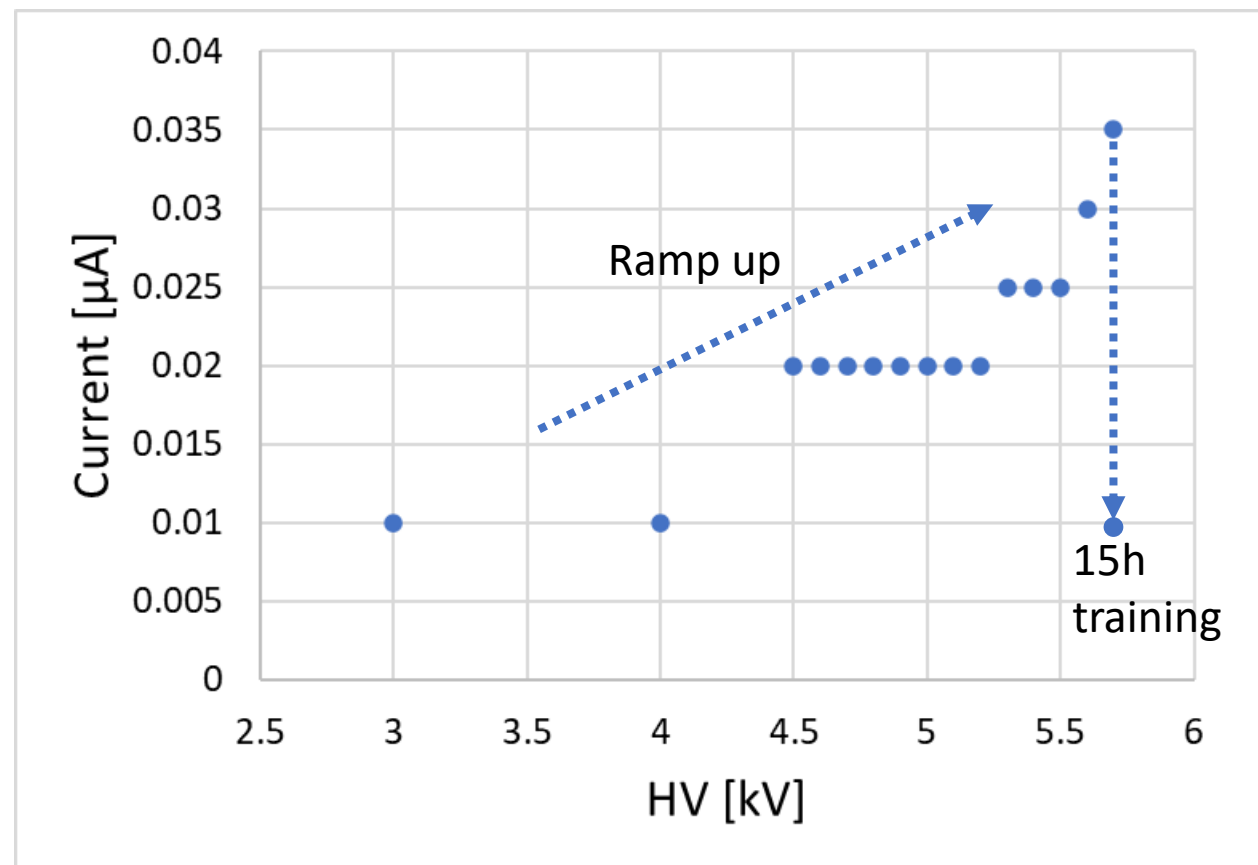

# Chamber with parallel fishline routing

One chamber (stack) assembled and applied with HV  
Not strictly parallel but open at both sides.

Flow: 20mL/min, 90/5/5 gas mixture

Reasonable dark current. Dark current relaxes slowly.

# Next step

---

- The primary target for now is to prepare the sealed MRPC2 prototype for the next mCBM beamtime
- A complete detector is being assembled for test.
- Laboratory test to check:
  - Long time operation stability.
  - Test with less flow rate.
  - X-ray test expected.
  - Gas route management.

*Thank you!*
