## **Neutrinos and their impact on the nucleosynthesis in binary neutron star mergers**

*Monday, 23 May 2022 16:20 (20 minutes)*

Recent measurements of gravitational waves and kilonova observations show that neutron star mergers are an important source of r-process elements. In fact, this astrophysical scenario is by now the first and only confirmed site of r-process element production. A reliable modelling of neutrino transport plays a key role in determining the ejecta composition and the resulting nucleosynthesis. In this talk, I will give an overview on neutron star mergers as sources of heavy elements and discuss different neutrino transport models and in specific, the newly presented leakage scheme ILEAS (Ardevol-Pulpillo et al. 2019) that is used in our neutron star merger simulations.

**Presenter:** VIJAYAN, Vimal (GSI Helmholtzzentrum für Schwerionenforschung GmbH(GSI))
