Identification with Machine Learning Techniques

Model Systematic Deviations

Measurement Systematic Deviations

Field Errors

Identification with Machine Learning Techniques

Model Systematic Deviations

Measurement Systematic Deviations

# Field Errors

- ▶ unwanted multipoles
  - ▶ excite resonances
  - ▶ reduce dynamic aperture
  - ▶ cause beam loss
- ▶ mitigation and correction
  - ▶ compensation computable from accurate model
  - ▶ requires type, location and strength
  - ▶ dedicated beam time necessary to find them
    - LOCO-algorithm, non-linear tune response matrix

# Accelerator Set Up

# Accelerator Set Up

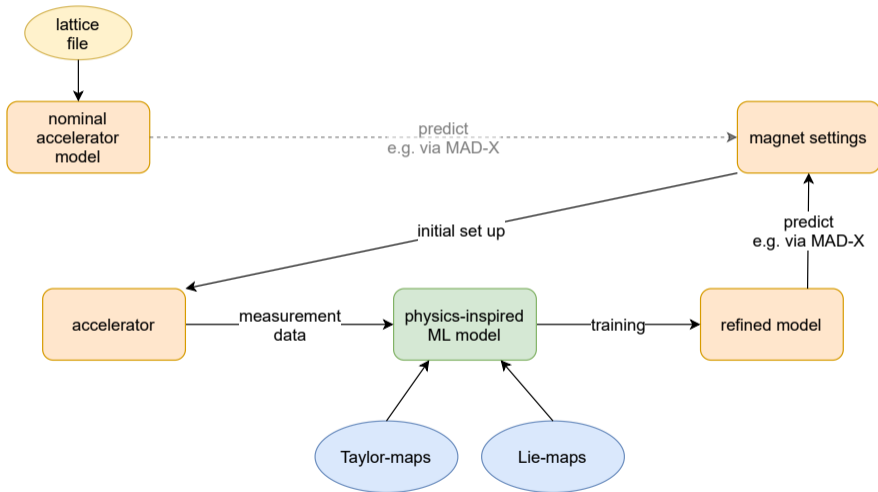

SIS18 measurements

-> tunes show systematic shift

-> quadrupole error present in accelerator

# Accelerator Set Up

# Goal: Identify Field Errors

## Goal

- ▶ identify field errors from measurements
- ▶ support operation of accelerator

## approach

1. compare measurements and predictions of accelerator model
2. quantify difference by loss  $\mathcal{L}$
3. minimize  $\mathcal{L}$  by varying multipole strengths of model

⇒ obtain accurate representation of accelerator

⇒ identify linear & non-linear field errors

Field Errors

Identification with Machine Learning Techniques

Model Systematic Deviations

Measurement Systematic Deviations

# Loss

loss  $\mathcal{L}$

- ▶ quantify difference of trajectories
- ▶ measurements: observe motion of beam centroid with BPMs

$$\mathcal{L} = \sum_{N_{\text{turns}}} \sum_{N_{\text{BPM}}} \left( \frac{1}{\hat{\sigma}} \begin{bmatrix} x \\ y \end{bmatrix} \Big|_{\text{measurement}} - \frac{1}{\hat{\sigma}} \begin{bmatrix} x \\ y \end{bmatrix} \Big|_{\text{model}} \right)^2 \quad (1)$$

$\hat{\sigma}$  normalization factor  $\propto \text{var}(x), \text{var}(y)$

# Accelerator Model

self-implemented tracking code with automatic differentiation

- ▶ based on drift-kick approximation, 6D tracking
- ▶ concatenation of differentiable maps
  - ▶ enable differentiation of whole tracking model w.r.t. multipole strengths
  - ▶ compute  $\frac{\partial \mathcal{L}}{\partial k_{i,j}}$  with  $k_{i,j}$   $i$ -th multipole of  $j$ -th magnet

# Accelerator Model

self-implemented tracking code with automatic differentiation

- ▶ based on drift-kick approximation, 6D tracking
- ▶ concatenation of differentiable maps
  - ▶ enable differentiation of whole tracking model w.r.t. multipole strengths
  - ▶ compute  $\frac{\partial \mathcal{L}}{\partial k_{i,j}}$  with  $k_{i,j}$  i-th multipole of j-th magnet
- ▶ single particle tracking
- ▶ features
  - ▶ exact drifts, no truncation
  - ▶ transversal magnetic fields up to arbitrary order
  - ▶ linearized dipole edges
- ▶ benchmarked against MAD-X, SixTrackLib

# Analogy to Artificial Neural Networks (ANNs)

similarities to artificial neural networks

- ▶ concatenation of simple, non-linear maps
- ▶ optimization of some scalar loss over training set
- ▶ large amount of tunable parameters
- ▶ well suited for automatic differentiation
  - ▶ stochastic gradient descent

⇒ use gradient based algorithms designed to train ANNs

⇒ identify linear & non-linear field errors

# Application to SIS18 in Simulations

## Presentation of Problem

goal: locate order & strength of field error

- ▶ hide field errors in accelerator
  - ▶ quadrupoles
  - ▶ sextupoles
  - ▶ octupoles
- ▶ training robust against additional deviations?
  - ▶ finite integration order of magnets
  - ▶ hide multipoles in accelerator not captured by training

# Application to SIS18 in Simulations

## Presentation of Problem

goal: locate order & strength of field error

- ▶ hide field errors in accelerator
  - ▶ quadrupoles
  - ▶ sextupoles
  - ▶ octupoles
- ▶ training robust against additional deviations?
  - ▶ finite integration order of magnets
  - ▶ hide multipoles in accelerator not captured by training
- ▶ learning parameters
  - ▶  $k_1, k_2, k_3$
  - ▶ at two locations per cell  
⇒ 72 free parameters
- ▶ training data set
  - ▶ 18 trajectories for different initial conditions

# Application to SIS18 in Simulations

## Results

exemplary training run

$\Rightarrow$  no overfitting

$\Rightarrow$  resolution: quadrupole errors  $\propto 10^{-7} \text{ m}^{-2}$ , sextupoles  $\propto 10^{-6} \text{ m}^{-3}$

# Application to SIS18 in Simulations

## Overview

- ▶ successful identification of field errors in simulations
- ▶ possible to identify
  - ▶ quadrupoles
  - ▶ sextupoles
  - ▶ octupoles

# Outline

Field Errors

Identification with Machine Learning Techniques

**Model Systematic Deviations**

Measurement Systematic Deviations

# Steps Towards Application at Accelerators

steps towards training with measured data

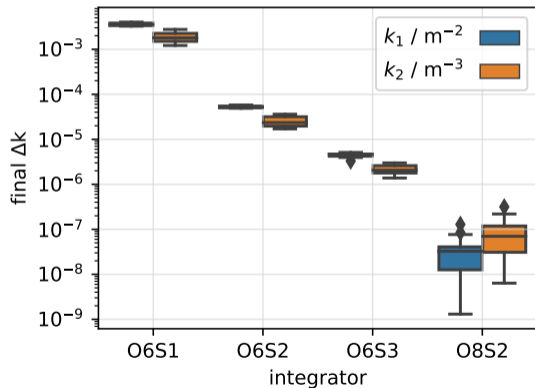

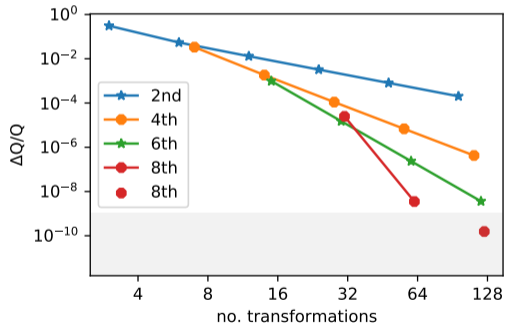

model systematic deviations

1. resolution of multipoles?
2. effect of uncaptured non-linearities?
3. influence of working point?

# 1) Possible Resolution of Field Errors

symplectic integrator of finite order

► tradeoff between accuracy and speed

⇒ possible to resolve field errors with sufficiently fast model

## 2) Effect of Additional Field Errors

training possible if additional unconsidered non-linearities present?  
train  $k_1$ ,  $k_2$ , hide unconsidered octupole error in SIS18

$\Rightarrow$  unconsidered octupole: resolution still feasible

(errors in SIS18:  $\Delta k_1 \propto 5 \times 10^{-3} \text{ m}^{-2}$ ,  $\Delta k_2 \propto 10^{-2} \text{ m}^{-3}$ )

### 3) Influence Working Point on Training

$\Rightarrow$  no significant effect on quadrupole resolution  
 $\Rightarrow$  sextupole resolution acceptable for application to SIS18

(errors in SIS18:  $\Delta k_1 \propto 5 \times 10^{-3} \text{ m}^{-2}$ ,  $\Delta k_2 \propto 10^{-2} \text{ m}^{-3}$ )

# Steps Towards Application at Accelerators

steps towards training with measured data

model systematic deviations

1. resolution of multipoles?
2. effect of uncaptured non-linearities?
3. influence of working point?

measurement systematic deviations

1. how to obtain initial condition from measurements?
2. represent centroid motion by single particle motion?
3. training possible with finite BPM resolution?

# 1) Recovery of Initial Condition

## Hilbert Transform

model does particle tracking  $\Rightarrow$  require initial condition  
get  $x, y$  from BPMs, how to get  $p_x, p_y$ ?

# 1) Recovery of Initial Condition

## Hilbert Transform

model does particle tracking  $\Rightarrow$  require initial condition  
get  $x, y$  from BPMs, how to get  $p_x, p_y$ ?

### Hilbert transform

- ▶ applies  $\pm \frac{\pi}{2}$  phase shift to signals
- ▶ use to obtain transversal momenta in normalized phase space coordinates
- ▶ requires precise knowledge of twiss parameters

# 1) Recovery of Initial Condition

## Leverage Kickers

model does particle tracking  $\Rightarrow$  require initial condition  
get  $x, y$  from BPMs, how to get  $p_x, p_y$ ?

### Hilbert transform

- ▶ applies  $\pm \frac{\pi}{2}$  phase shift to signals
- ▶ use to obtain transversal momenta in normalized phase space coordinates
- ▶ requires precise knowledge of twiss parameters

### alternative: kick beam

- ▶ beam at rest  
 $[x, p_x, y, p_y] = [0, 0, 0, 0]$
- ▶ kick beam  $\rightarrow$  set momenta
- ▶ requires precise knowledge of kicker field

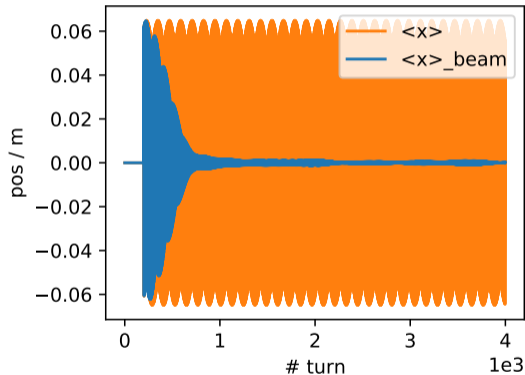

## 2) Effect of Decoherence on Training

How good can single-particle motion represent bunch motion?

- ▶ decoherence: particles oscillate with different tunes  $\nu \Rightarrow$  beam debunches
  - ▶ effect on training resolution?
- ▶ two mechanisms
  - ▶ amplitude detuning:  $\nu_z \rightarrow \nu_z(J_z)$   
detuning  $\propto \epsilon_x, \epsilon_y$
  - ▶ chromatic detuning:  $\nu_z \rightarrow \nu_z(\delta)$   
detuning  $\propto \sigma_E$

## 2) Effect of Decoherence on Training

How good can single-particle motion represent bunch motion?

difference in bunch motion and single particle motion after kick

## 2) Effect of Decoherence on Training

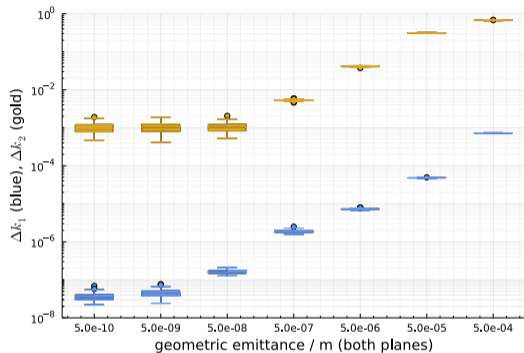

Figure: Resolution vs. geometric emittance.

Figure: Resolution vs. rms energy spread.

amplitude detuning

chromatic detuning

(errors in SIS18:  $\Delta k_1 \propto 5 \times 10^{-3} \text{ m}^{-2}$ ,  $\Delta k_2 \propto 10^{-2} \text{ m}^{-3}$ )

### 3) Resolve Influence of Multipoles with BPMs

How much does centroid motion change over 3 turns?

kick beam and track centroid with / without field error

resolution of BPMs  $\sim 10 \mu\text{m}$

$\Rightarrow$  resolve influence of gradient errors

$\Rightarrow$  effect of sextupole errors close to BPM resolution

# Conclusion

successful identification of field errors in simulations

- ▶ quadrupole, sextupole, octupole
- ▶ robust against
  - ▶ uncaptured non-linearities
  - ▶ chosen working point
  - ▶ finite integration order of magnets
- ▶ convergence affirmed by multitude of simulations
- ▶ no overfitting

# Conclusion

successful identification of field errors in simulations

- ▶ quadrupole, sextupole, octupole
- ▶ robust against
  - ▶ uncaptured non-linearities
  - ▶ chosen working point
  - ▶ finite integration order of magnets
- ▶ convergence affirmed by multitude of simulations
- ▶ no overfitting

training on real measurement data

- ▶ control initial conditions by kickers
- ▶ require 18 shots of synchrotron to create training data set
- ▶ representation of bunch centroid by single particle
  - ▶ resolution of multipoles affected
- ▶ finite resolution of BPMs
  - ▶ identify gradient errors in SIS18
  - ▶ sextupole errors close to resolution limit

End

Thank you for your attention!

# References I

# Training Set

- ▶ ground truth to be fitted by model
- ▶ kick beam horizontally & vertically
- ▶ typical size of train set: 18 trajectories

# Detuning in presence of Exact Drifts

- ▶ study detuning caused by exact drifts
- ▶ compare motion of beam centroid to centroid particle
- ▶ beam parameters
  - ▶ geo. emittance  $\epsilon_x = \epsilon_y = 34 \mu\text{m}$
  - ▶ monoenergetic beam,  $\sigma_E = 0$

(a) Linear lattice with **exact** drifts.

(b) Linear lattice with **linear** drifts.
