

Summary of Giessen Testbeam Results

Peter Koch on behalf of AG Düren

Panda Coll. Meeting XL
Mar 5 - Mar 9, 2012

Our setup in December 2011

PMT

1

2

3

4

5

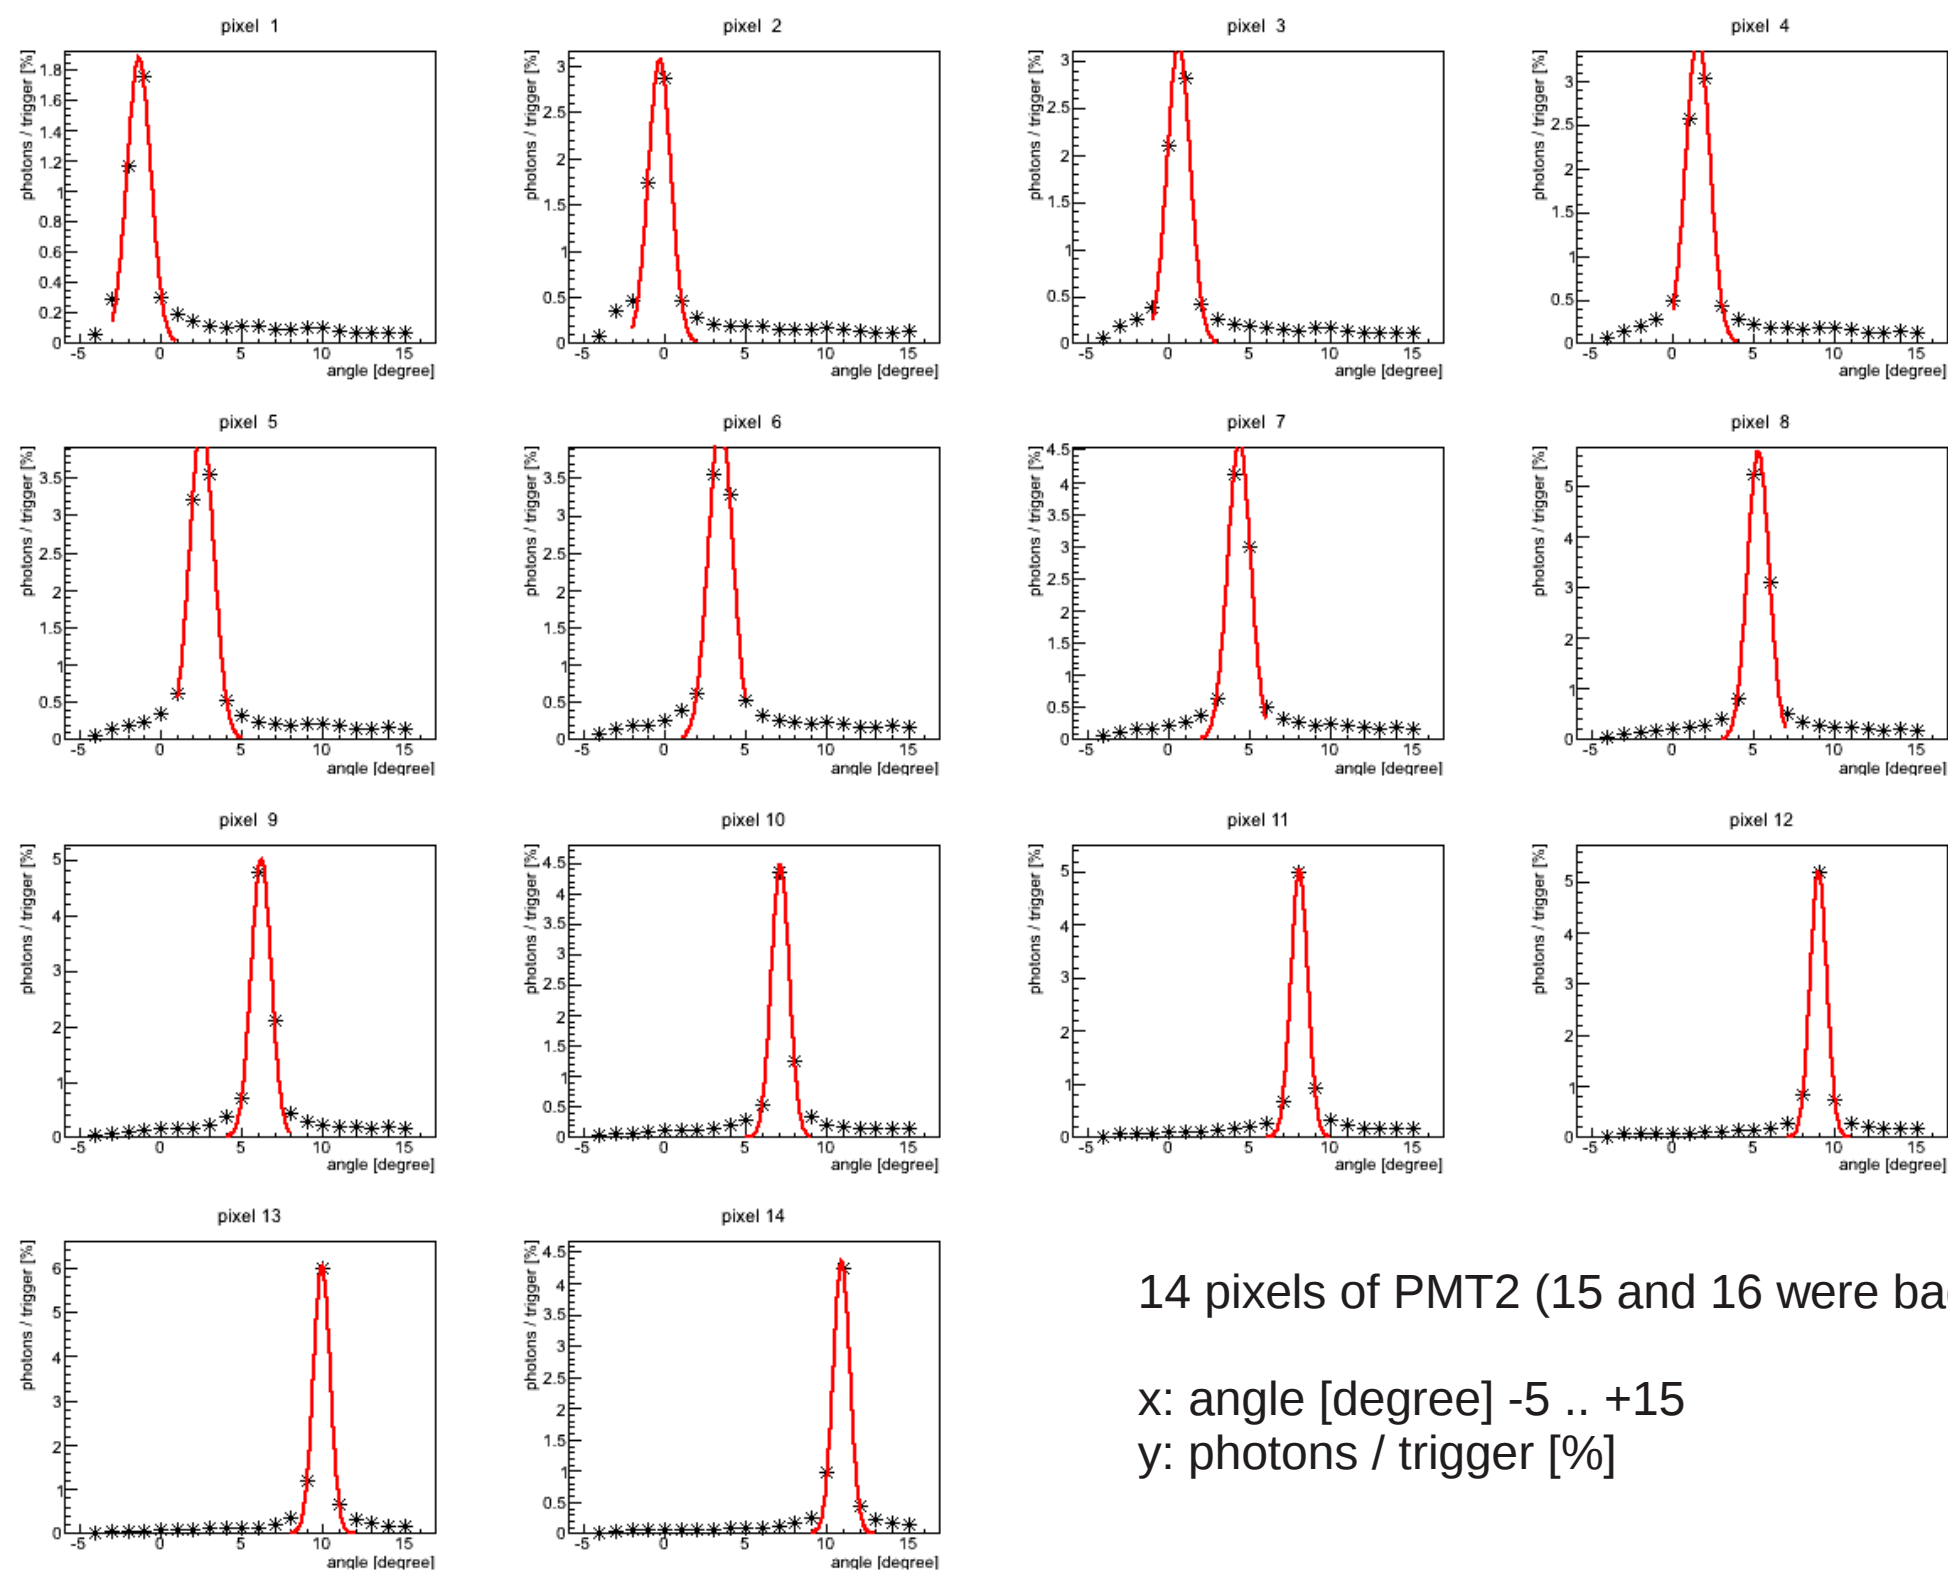

Angle Scan in front of PMT 2

for each pixel and each angle:

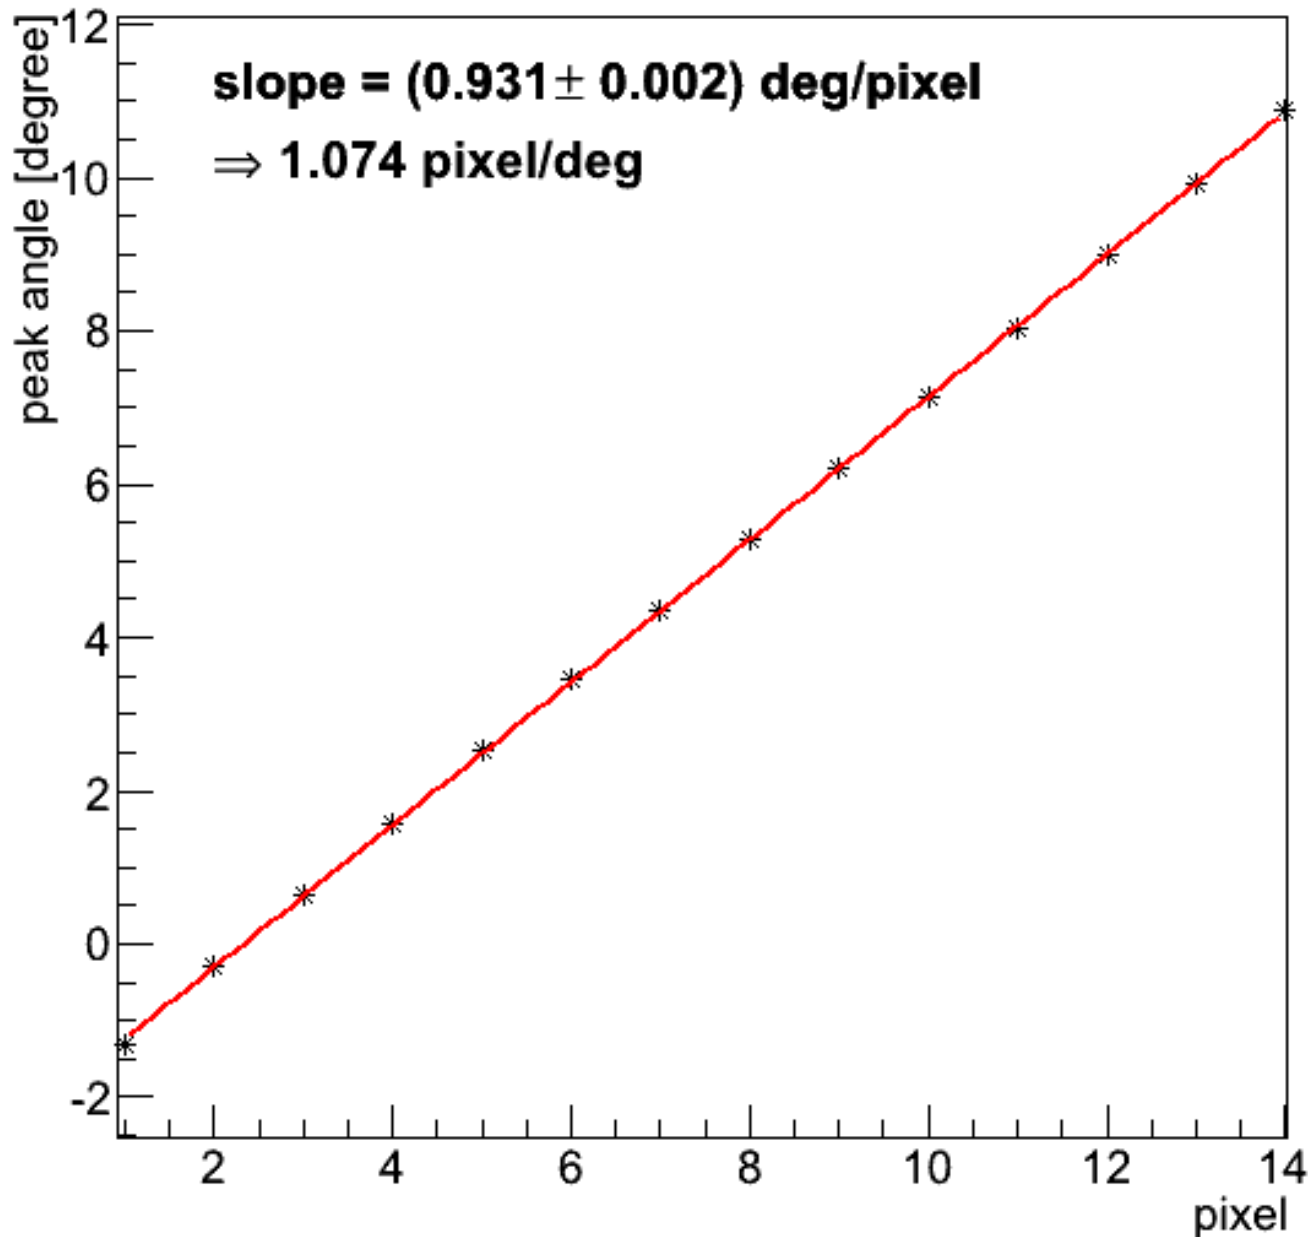

- plot time spectrum „trigger – signal“
- fit the peak
- calculate number of entries
- plot that number as function of angle

14 pixels of PMT2 (15 and 16 were bad)

x: angle [degree] -5 .. +15
 y: photons / trigger [%]

Angle vs Pixel (PMT 2)

LightGuide design:

angle range:

$$\Delta \alpha = 25.7^\circ$$

focal plane

$$\Delta L = 29.4 \text{ mm}$$

pixel width

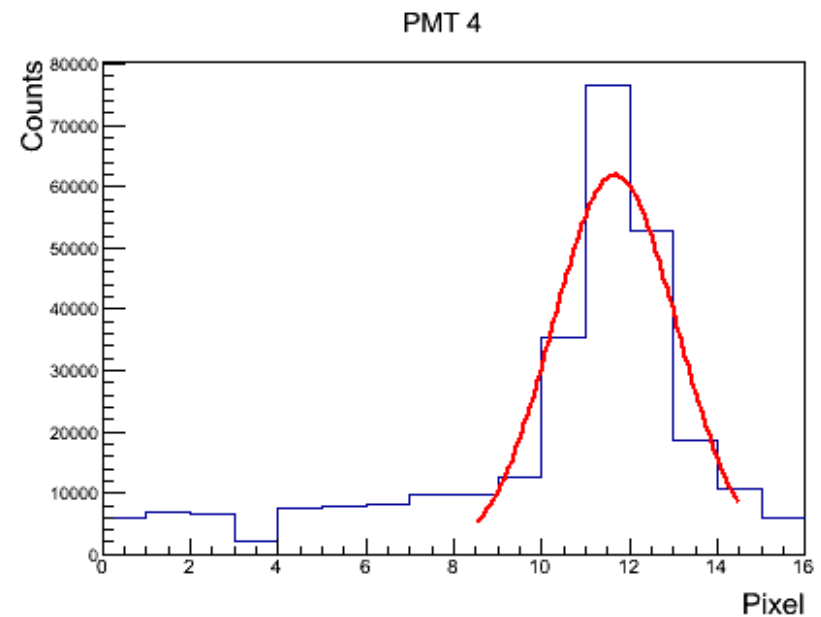

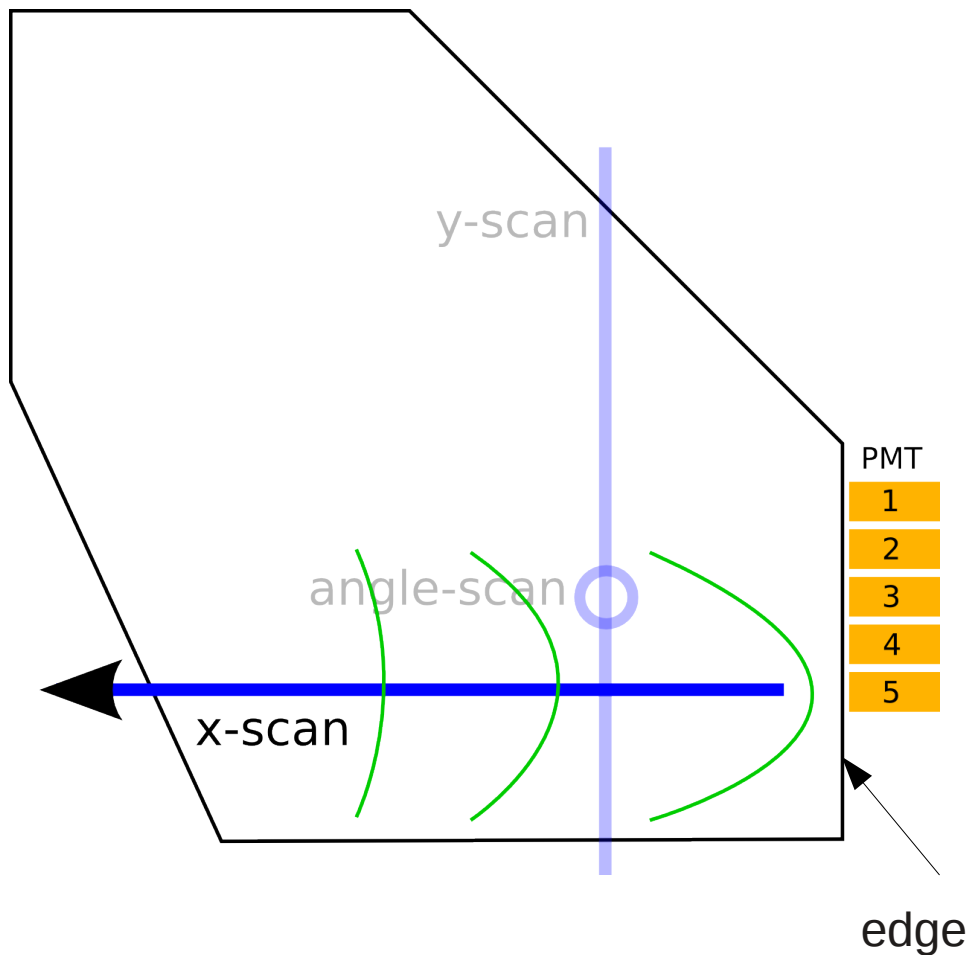

$$= 1 \text{ mm}$$

$$\frac{\Delta L}{\Delta \alpha} = 1.14 \frac{\text{pxl}}{\text{deg}}$$

x-Scan in front of PMT 1 and 5

for each PMT and each position:

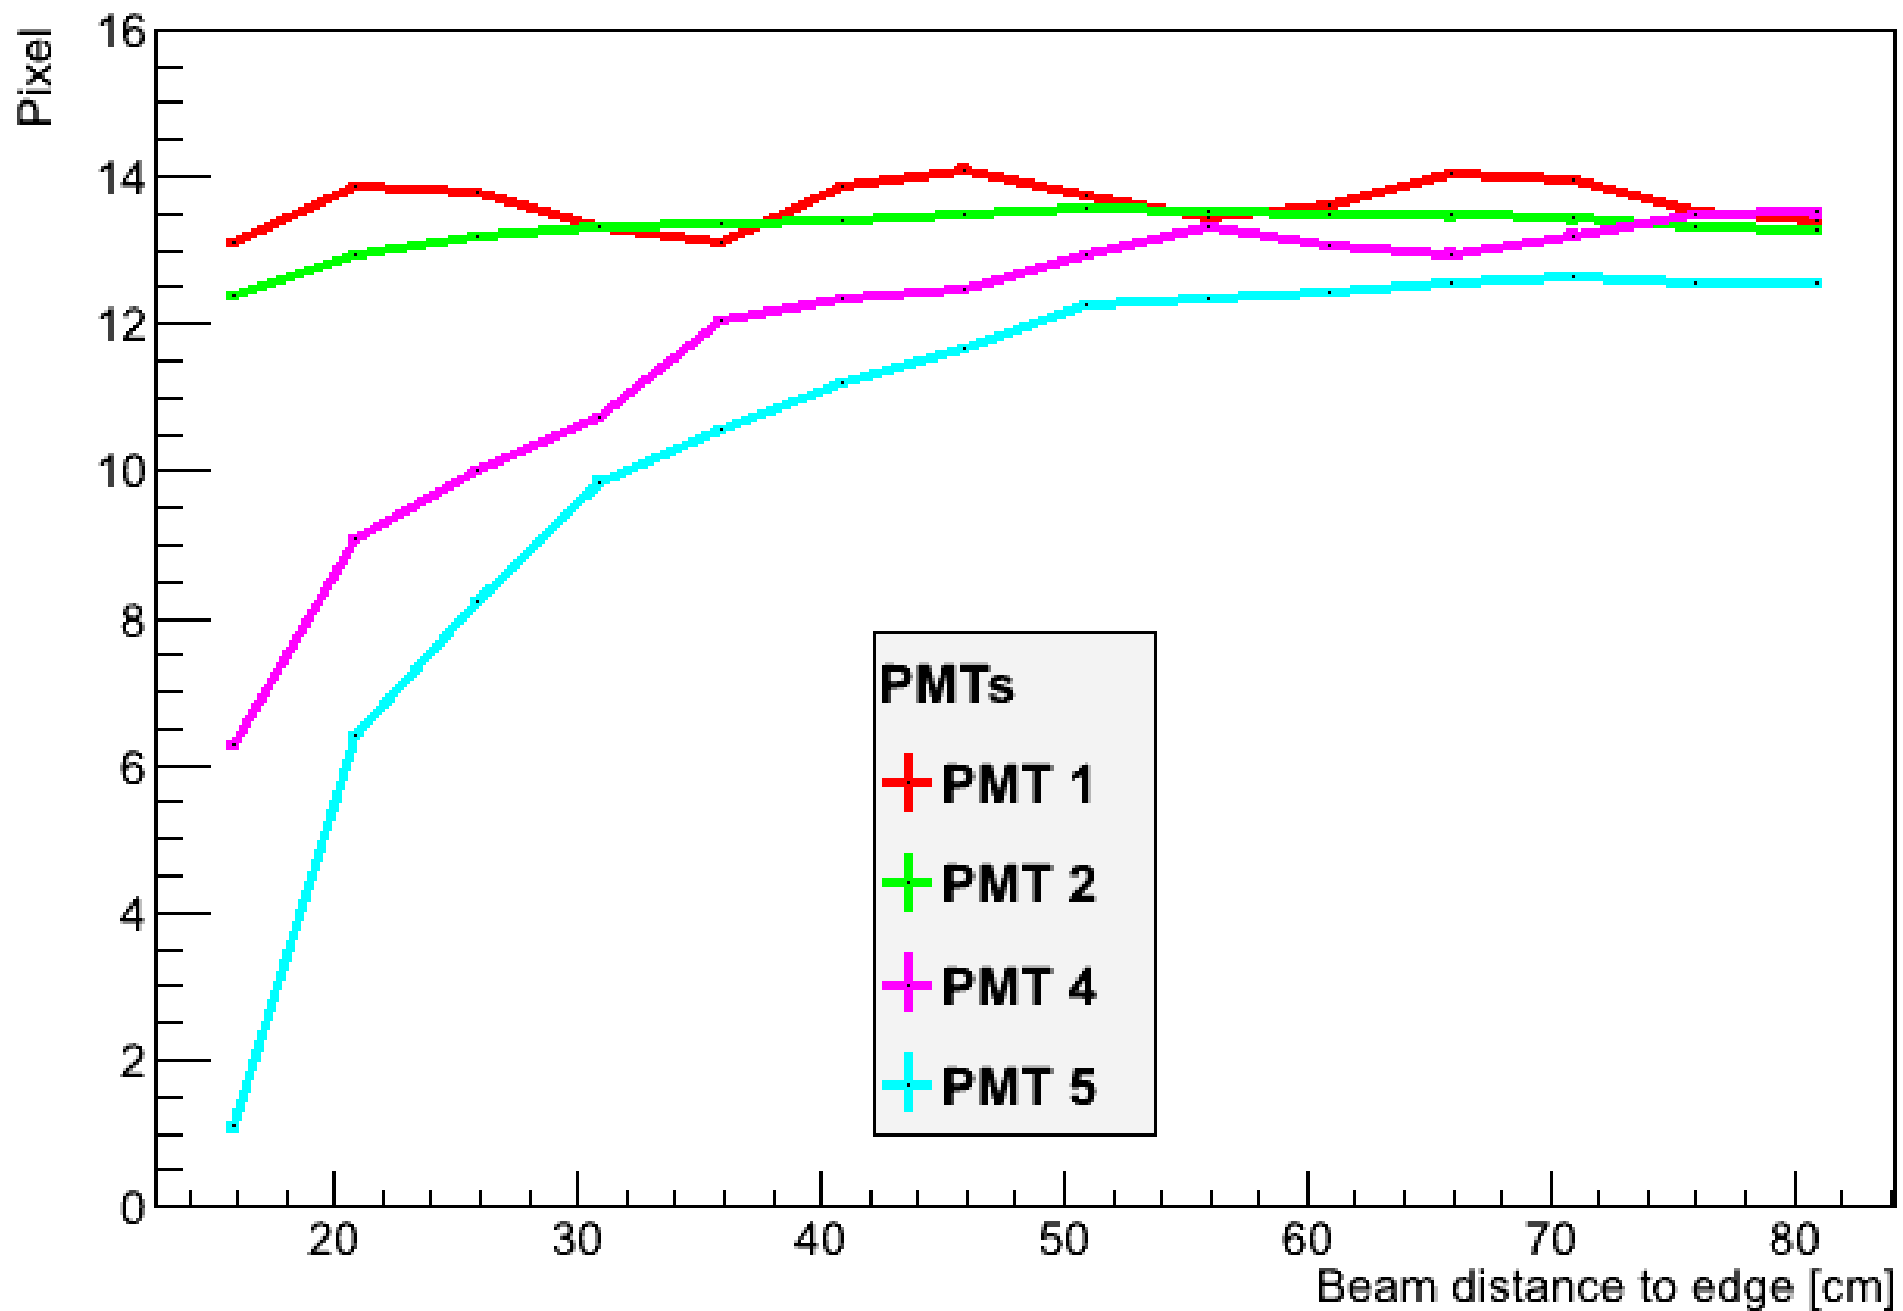

- plot number of entries in each pixel
- fit histogram to find mean pixel

x-Scan in front of PMT 5

x-Scan in front of PMT 1

ToP for PMT 1 in x-Scan

scan in front of PMT 1:

- for PMT 1 same pixel hit in each run

for each position:

- plot time spectrum „trigger – signal“
- fit the peak to get hit time
- plot time vs position

ToP for PMT 1 in x-Scan

photon speed in medium

$$c_m = \frac{c}{n} \approx 20.2 \frac{cm}{ns}$$

projection on radiator surface

$$c_p = \cos(31^\circ) \cdot c_m$$
$$\approx 17.5 \frac{cm}{ns}$$

$$\frac{1}{c_p} \approx 5.716 \frac{ps}{mm}$$

Summary and Outlook

- LightGuides focus as designed
- position scan results in expected behaviour for PMTs close to the scan-axis
- open issues / need to understand
 - get number of Photons
 - curves for PMTs away from scan-axis
 - focal quality of LGs
 - . . .
 - reconstruct events
