May 31, 2022

Introduction

$$p\bar{p} \rightarrow \gamma M \quad \text{at large Mandelstam variables}$$

process amplitudes factorizes:

Simulation and Event Selection

- Full MC simulation with PANDARoot Framework
- Signal $p\bar{p} \rightarrow \gamma\gamma$
- background $p\bar{p} \rightarrow \pi^0\gamma$ and $p\bar{p} \rightarrow \pi^0\pi^0$
- 1M signal and 1M background events simulated at beam momenta of 2.5, 5 and 10 GeV
- Events with at least two photons were selected
- Two gammas were combined to form initial $\bar{p}p$ system
- 4C fit is applied to select exclusive events

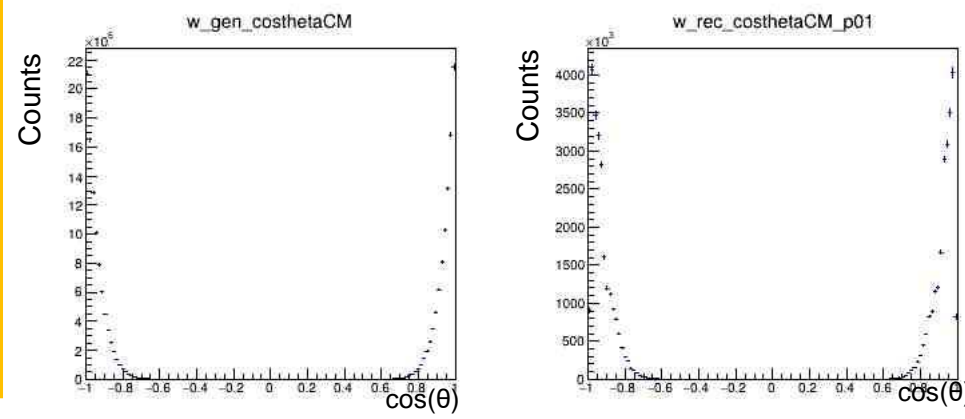

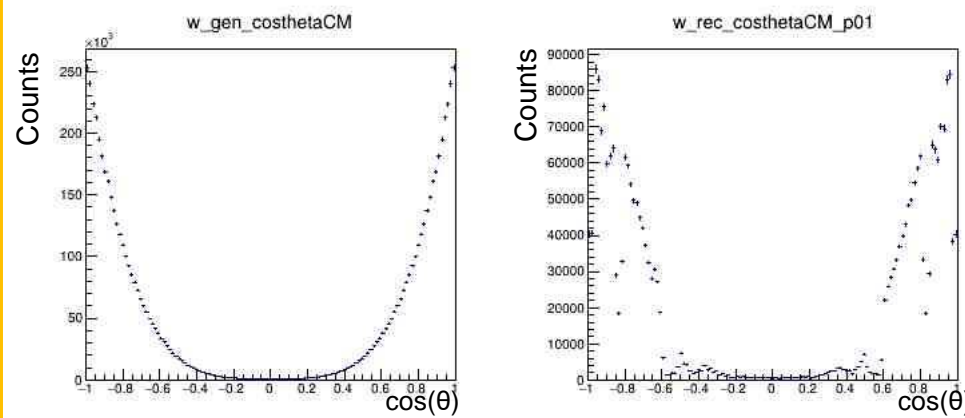

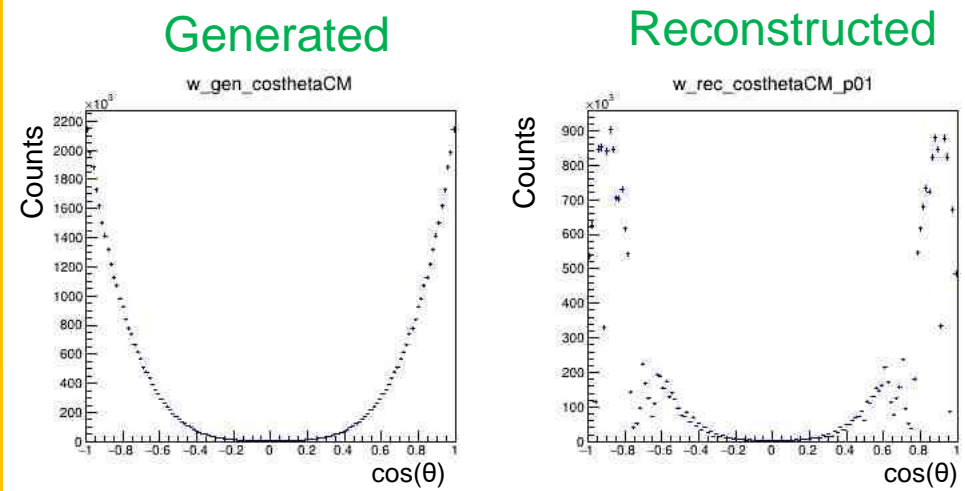

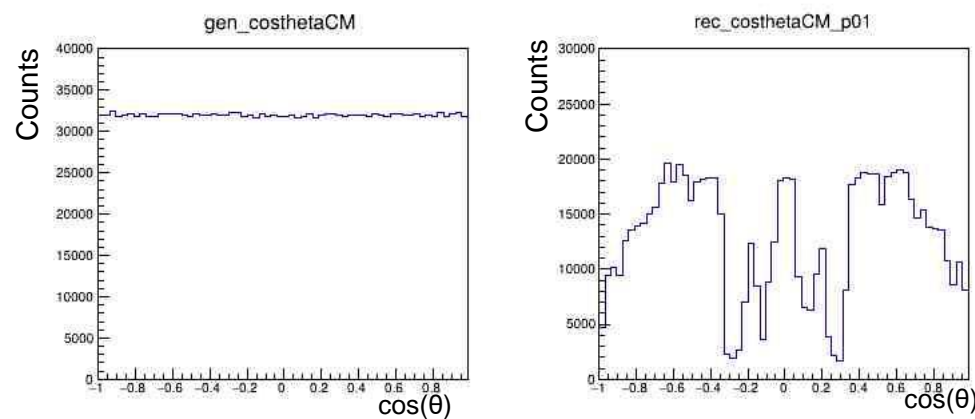

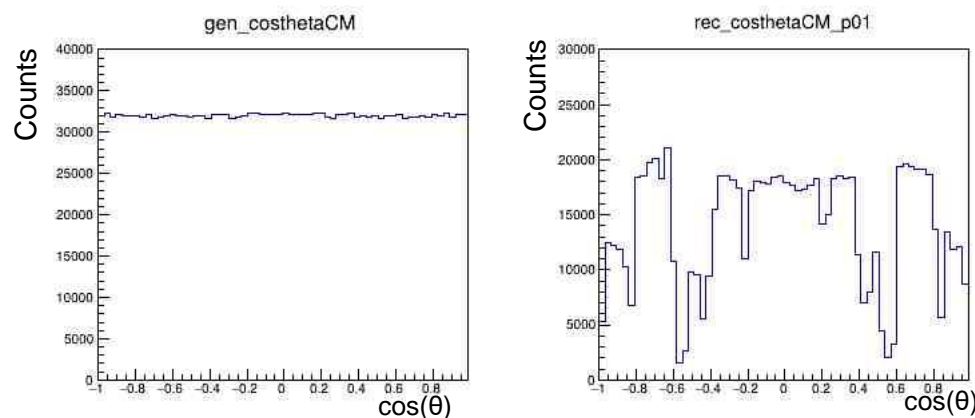

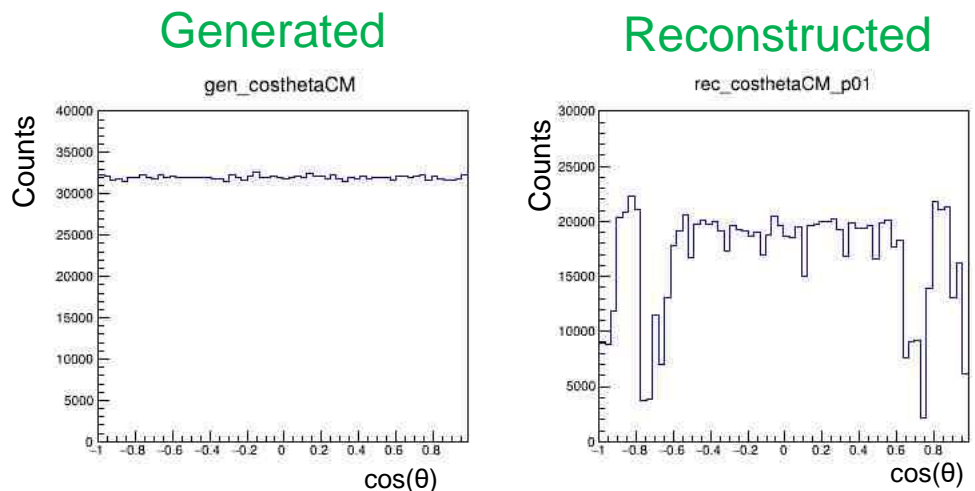

Phase Space Distribution

Weighted with Cross-Section

2.5 GeV/c

5 GeV/c

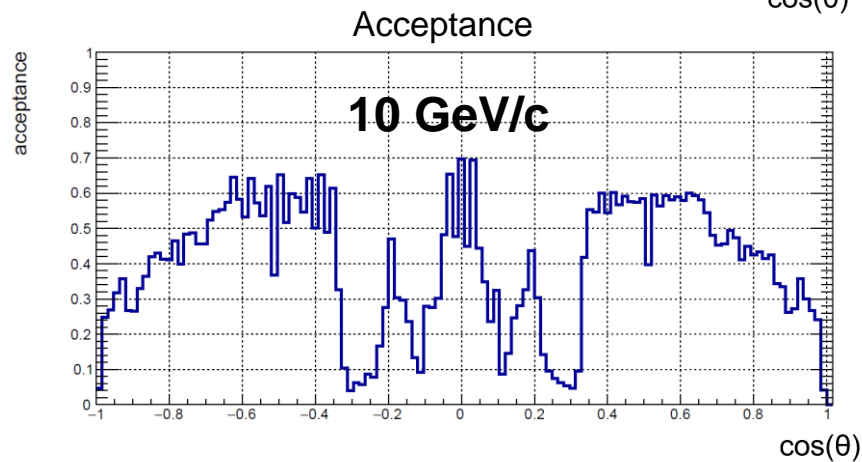

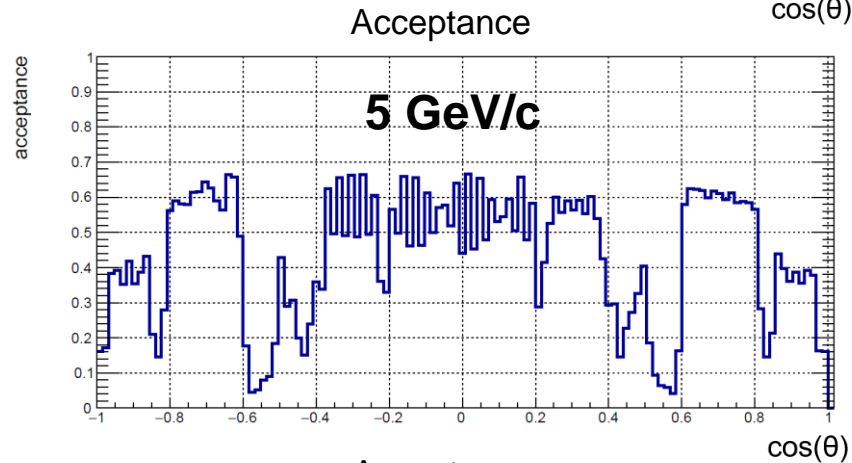

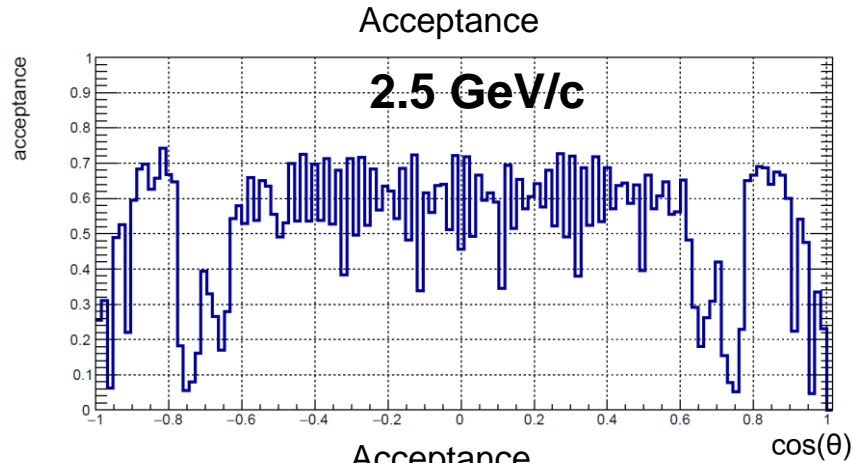

10 GeV/c

Acceptance for $p\bar{p} \rightarrow \gamma\gamma$

$$A = \frac{N_{rec}}{N_{gen}}$$

$$N_{corr} = \frac{N_{rec}}{A}$$

Cross-sections from E760 Data

- T. A. Armstrong*, Two-body neutral final states produced in antiproton-proton annihilations at $2.911 \leq \sqrt{s} \leq 3.686$ GeV
- Integrated the angular range for a fixed \sqrt{s} to get the partially integrated cross section in the $\cos(\theta)$ range which is available for all energies.

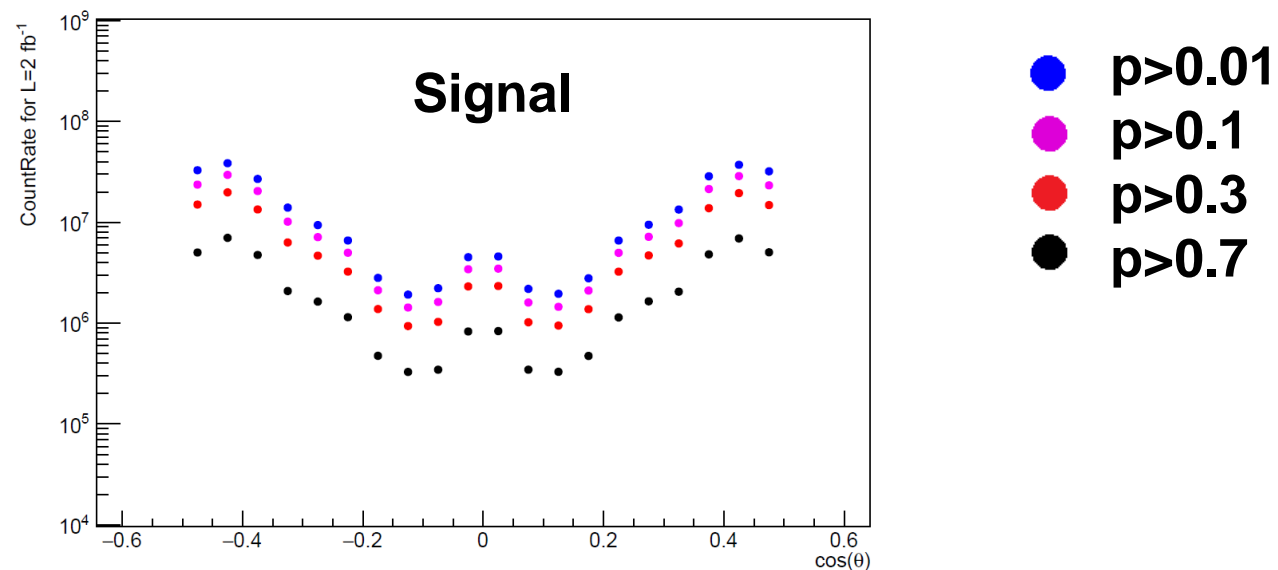

*<https://doi.org/10.1103/PhysRevD.56.2509>

Count Rate

$P_{\text{beam}} = 2.5 \text{ GeV}$

- Count rate = Cross section_{scaled}
* Acceptance * Integrated Luminosity
- Cross section_{scaled} = cross section_{E760}
* scaling factor

Count Rate

 $P_{\text{beam}} = 5 \text{ GeV}$ 

Count Rate

 $P_{\text{beam}} = 10 \text{ GeV}$ 

Count Rate for $\mathcal{L} = 2 \text{ fb}^{-1}$ and $\mathcal{L} = 0.1 \text{ fb}^{-1}$

● $p_{\text{beam}} = 2.5 \text{ GeV}/c$

● $p_{\text{beam}} = 5 \text{ GeV}/c$

● $p_{\text{beam}} = 10 \text{ GeV}/c$

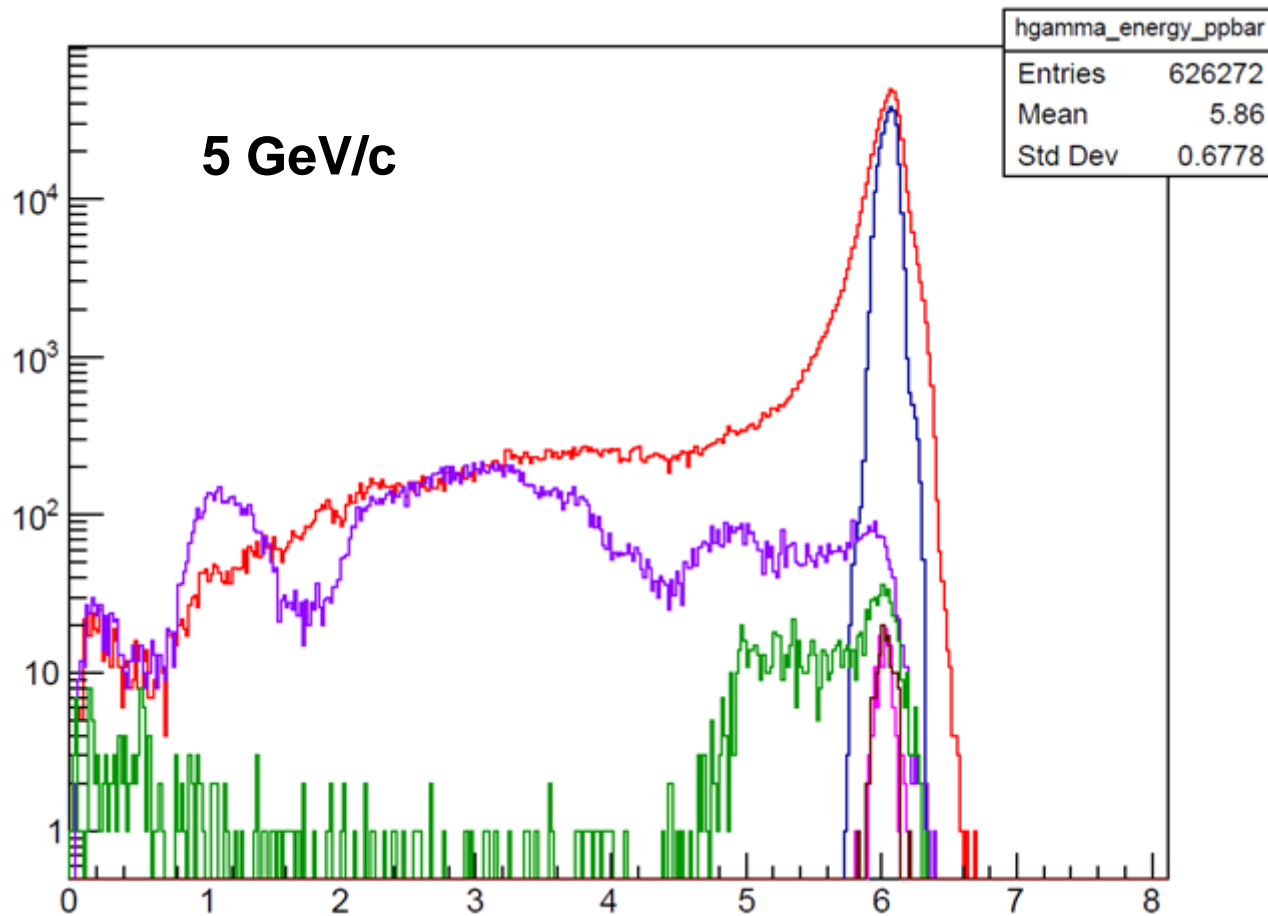

$\mathcal{L} = 2 \text{ fb}^{-1}$

$\mathcal{L} = 0.1 \text{ fb}^{-1}$

Background Suppression

- ★ count gamma=2
- ★ Kinematic fit + energy > 5.7

Signal:

- ★
- ★ ★

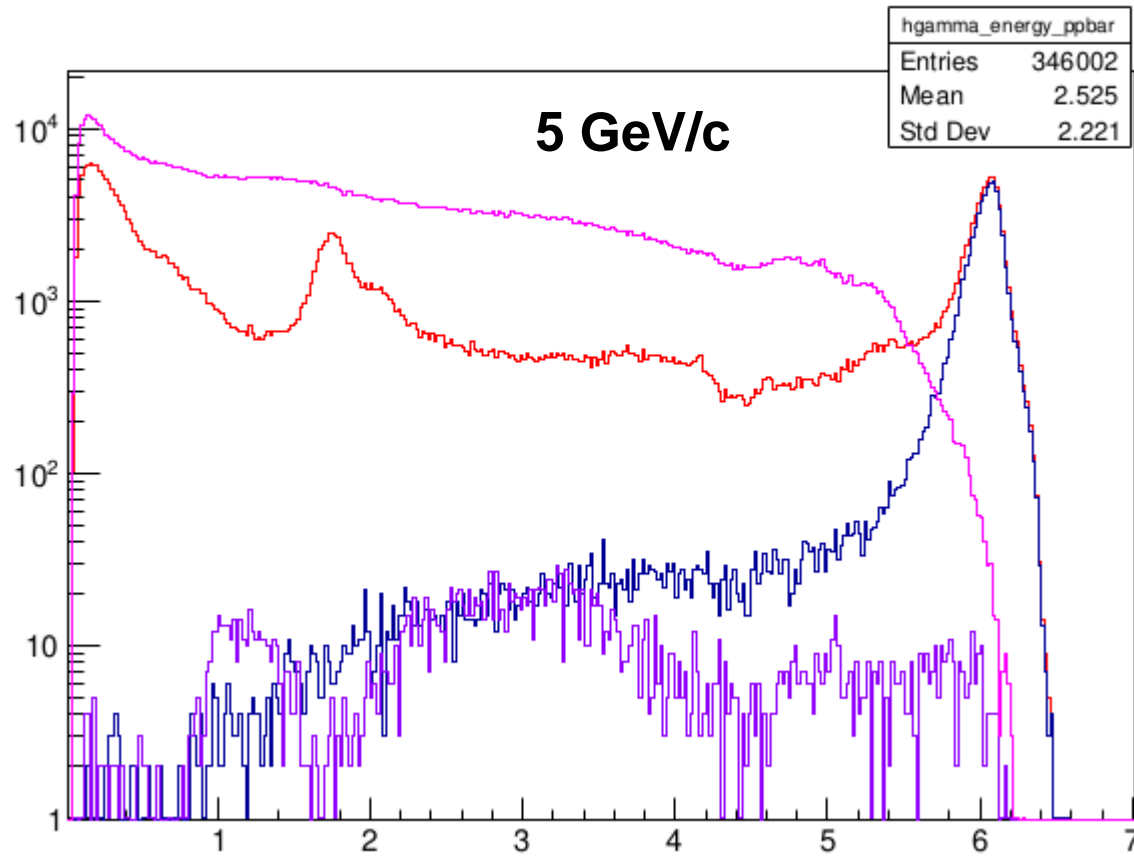

Bkg $\pi^0\pi^0$:

- ★
- ★ ★

Bkg $\pi^0\gamma$:

- ★
- ★ ★

Background Suppression

Signal $\gamma\gamma$:

count $\gamma > 1$

count $\gamma = 2$

Bkg $\pi^0\pi^0$:

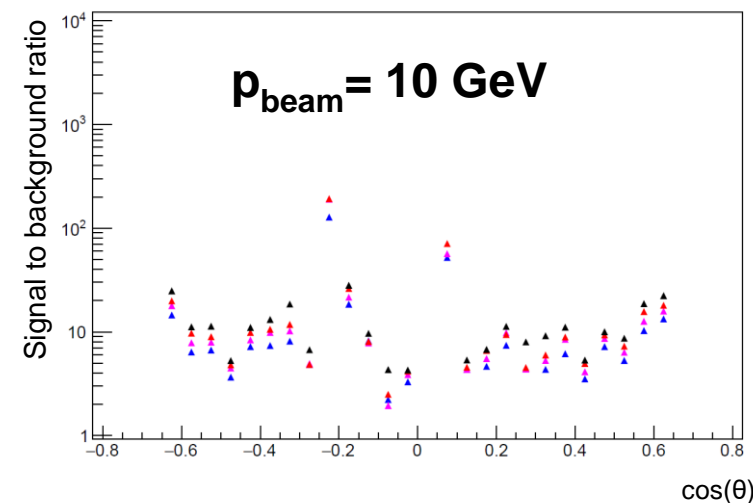

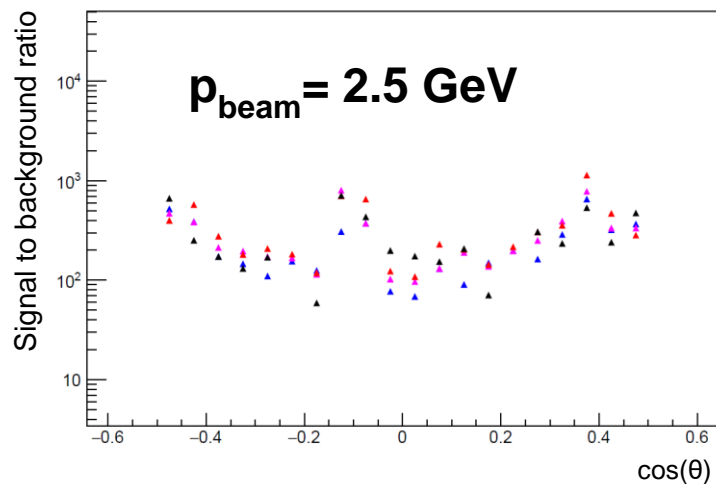

count $\gamma > 1$

count $\gamma = 2$

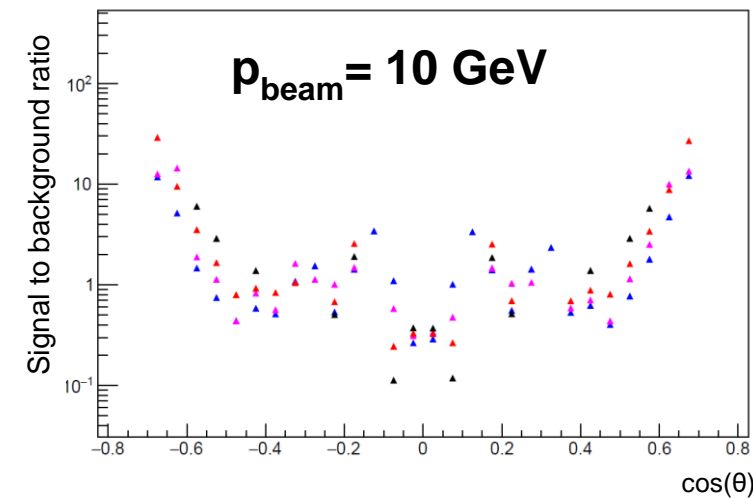

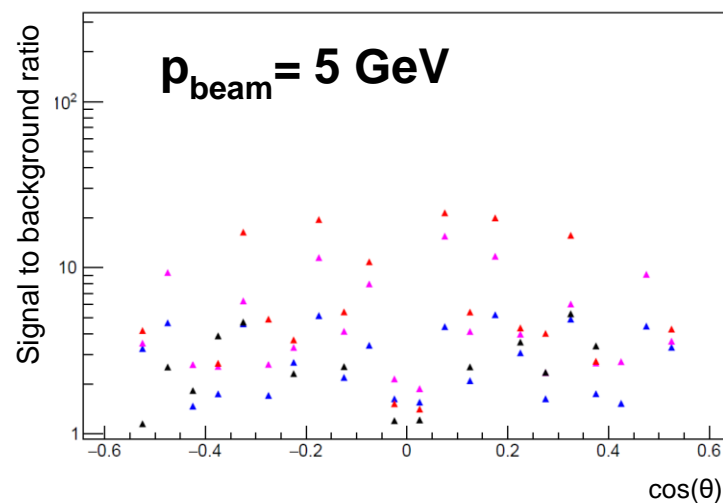

Signal to Background Ratio

- $p > 0.01$
- $p > 0.1$
- $p > 0.3$
- $p > 0.7$

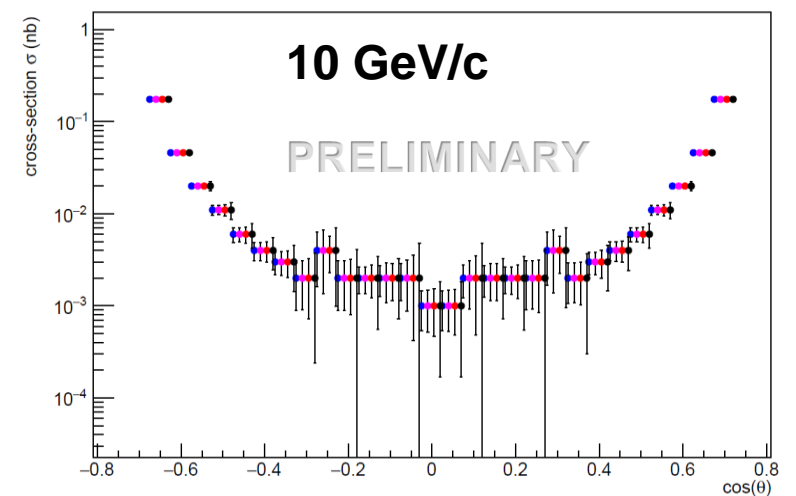

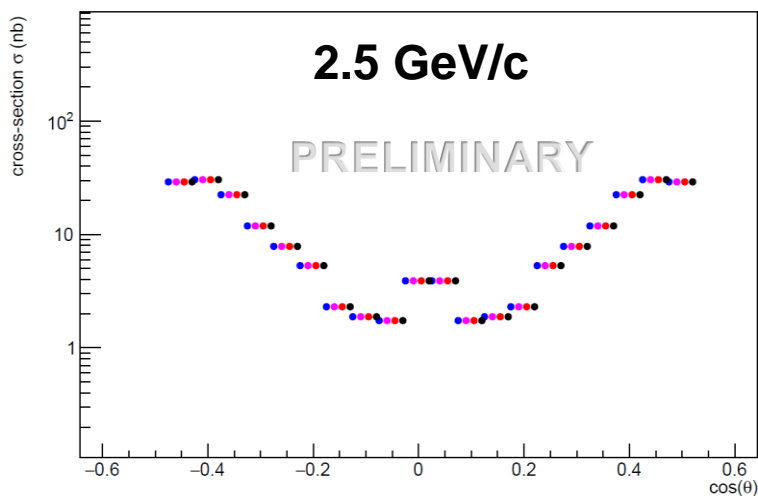

$\pi^0 \gamma$

$\pi^0 \pi^0$

Cross-section with Statistical Uncertainties

● $p > 0.01$ ● $p > 0.1$ ● $p > 0.3$ ● $p > 0.7$ Luminosity = 2 fb^{-1} Luminosity = 0.1 fb^{-1} 

Summary

- Exclusive event selection with 4C kinematic fit was performed
- Acceptance in $\cos(\theta)$ has been checked
- Acceptance corrections were done
- The $\cos(\theta)$ dependence of the cross-section has been implemented and a reconstruction study has been performed at $\sqrt{s} = 2.6 \text{ GeV}$, $\sqrt{s} = 3.4 \text{ GeV}$ and $\sqrt{s} = 4.5 \text{ GeV}$
- Count rate estimates and estimates of the expected statistical uncertainty was performed.
- Signal to background ratio was determined.
- Selection cuts were investigated to optimize the signal to background ratio while keeping a reasonable reconstruction efficiency.
- The channel $p\bar{p} \rightarrow \gamma\gamma$ can be well measured with \bar{P} ANDA but background has to be considered as it was done in the E760 experiment.

Thank You For Your Attention!

Suppressing the background

Effect on the sum of energies of the two gamma particles with increasing probability of Kinematic fit

- $p > 0.01$
- $p > 0.1$
- $p > 0.3$
- $p > 0.7$

Signal to Background Ratio- a comparison

▲ gamma count = 2

△ gamma count > 1

- p>0.01
- p>0.1
- p>0.3
- p>0.7

$\pi^0\gamma$

$\pi^0\pi^0$
