

# **Hassium spectroscopy experiments at TASCA**

Alexander Yakushev /RCM TU München/

for GSI-TUM-Uni Mainz-Uni Oslo-  
Uni Lund-LBNL-FLNR-..... collaboration

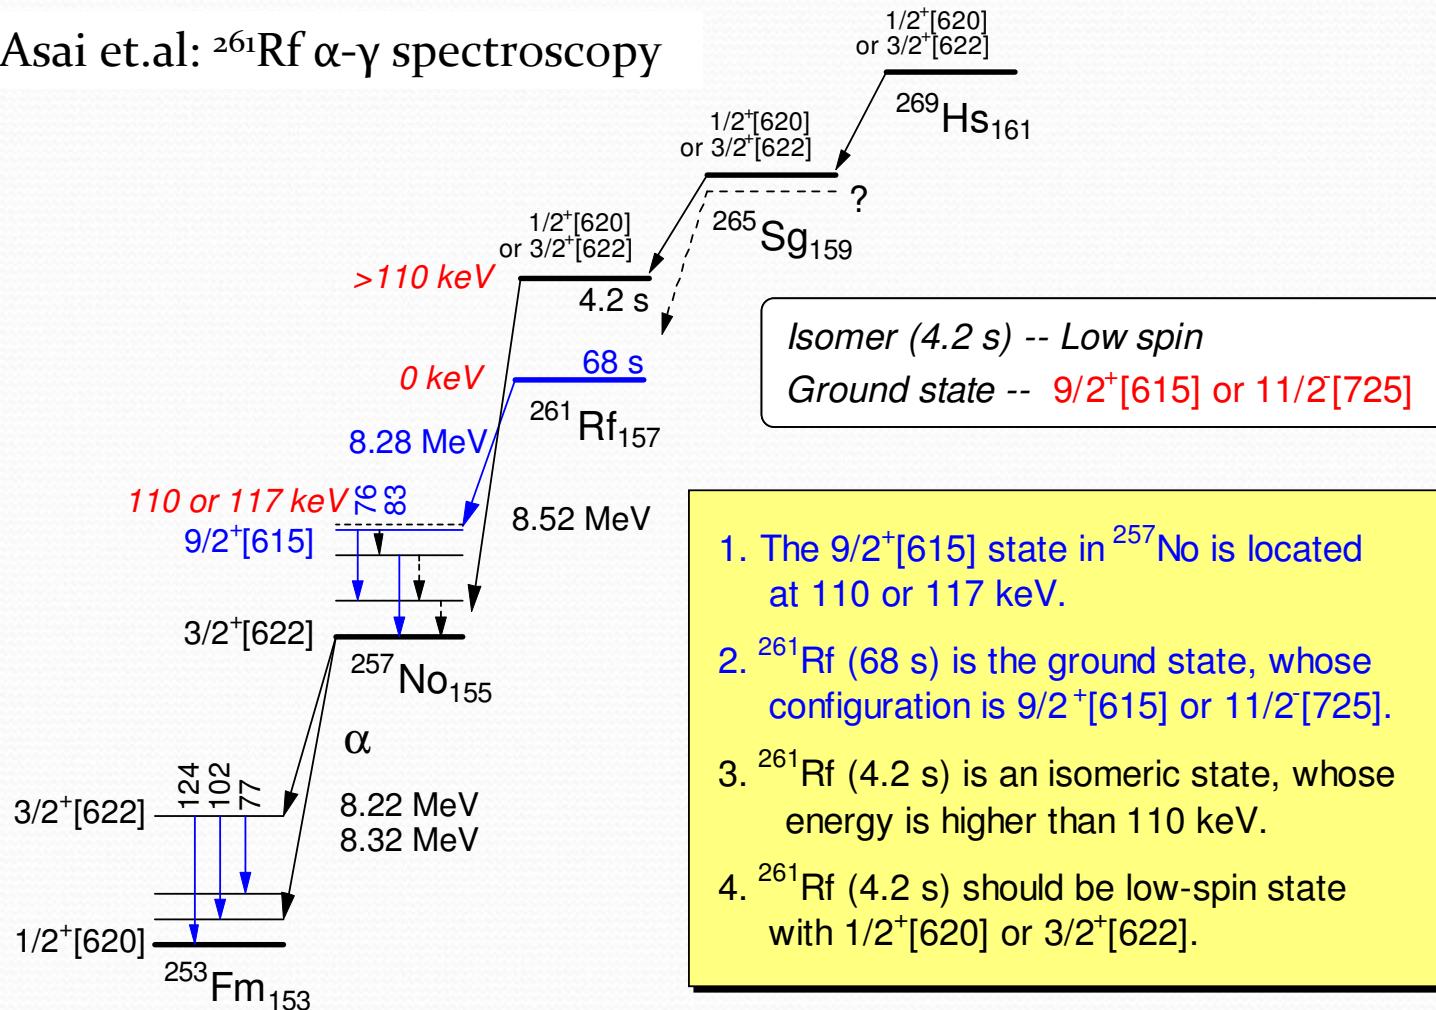

# Motivation

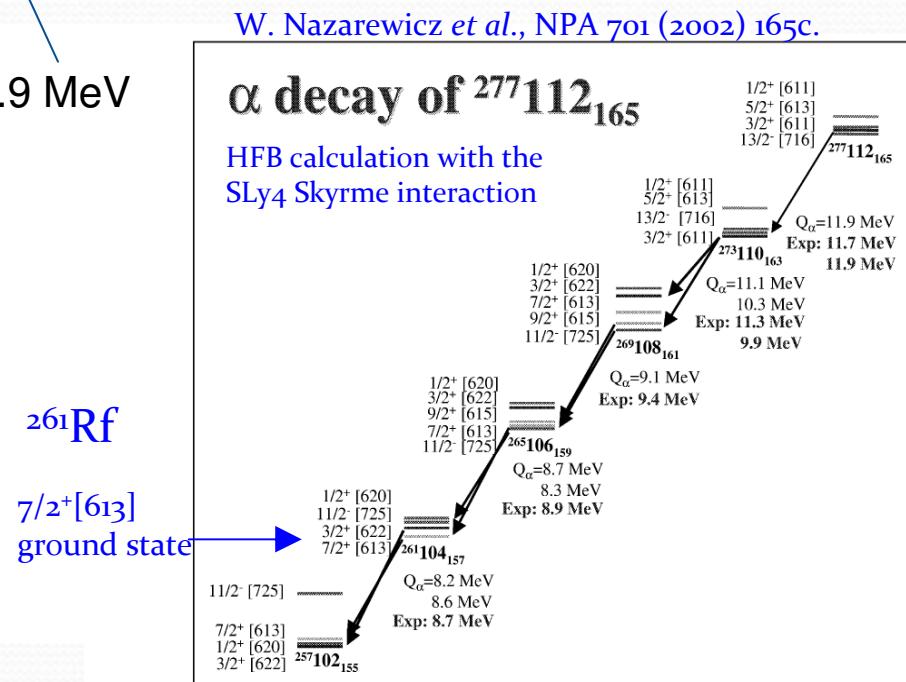

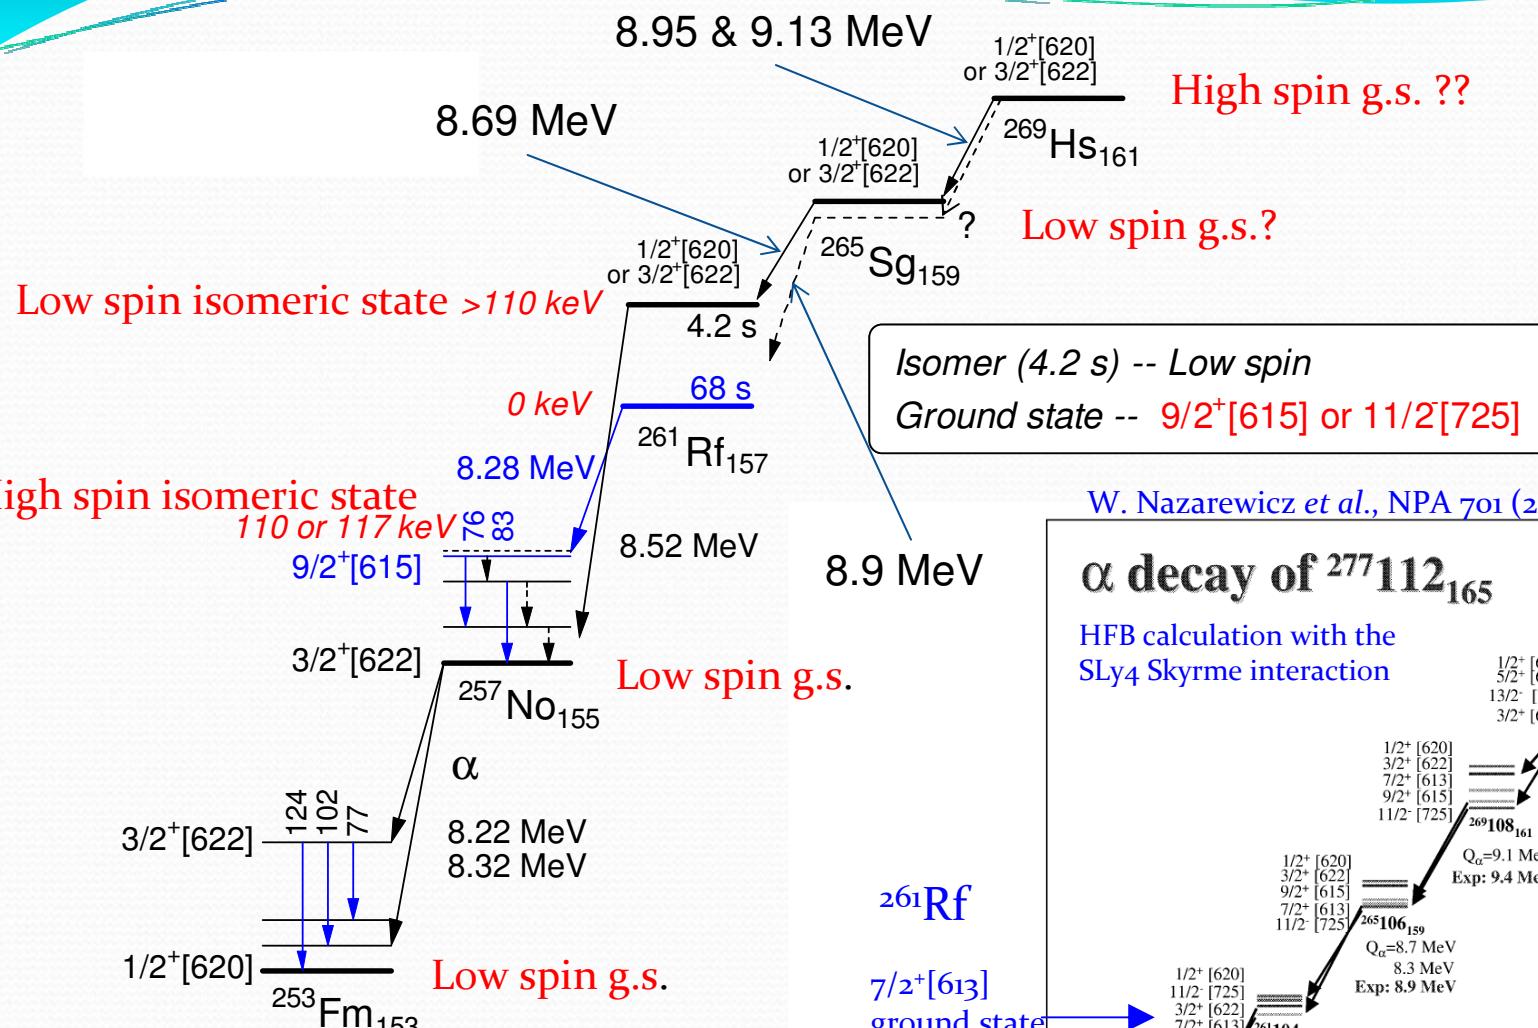

Isomeric state in  $^{265}\text{Sg}??$   
 $\alpha$  branch in  $^{266}\text{Sg}??$

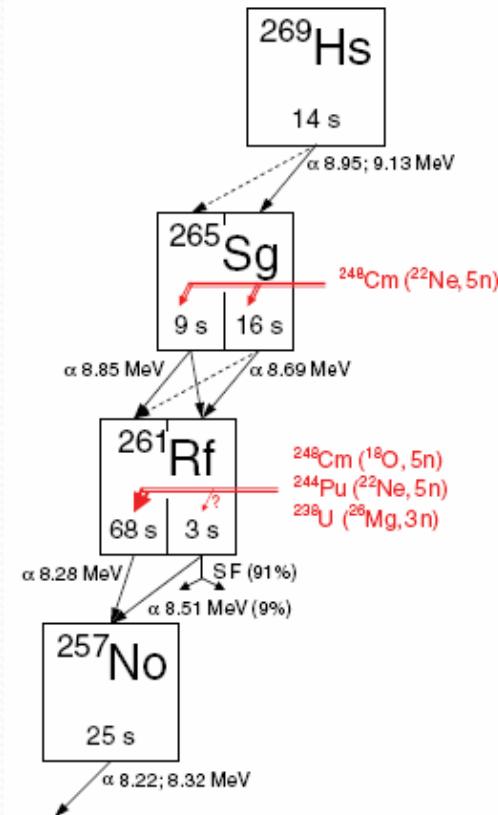

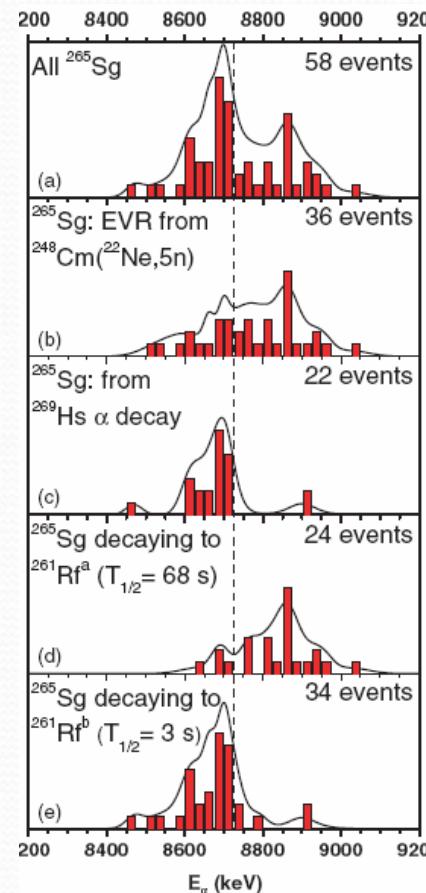

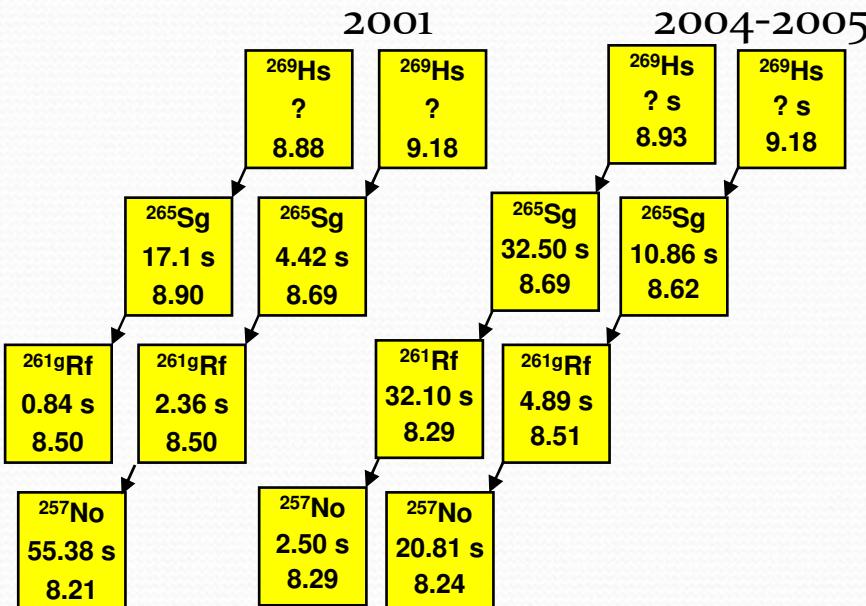

Isomeric state in  $^{261}\text{Rf}!$

## Asai et.al: $^{261}\text{Rf}$ $\alpha$ - $\gamma$ spectroscopy

# Does $^{265}\text{Sg}$ have an isomeric state?

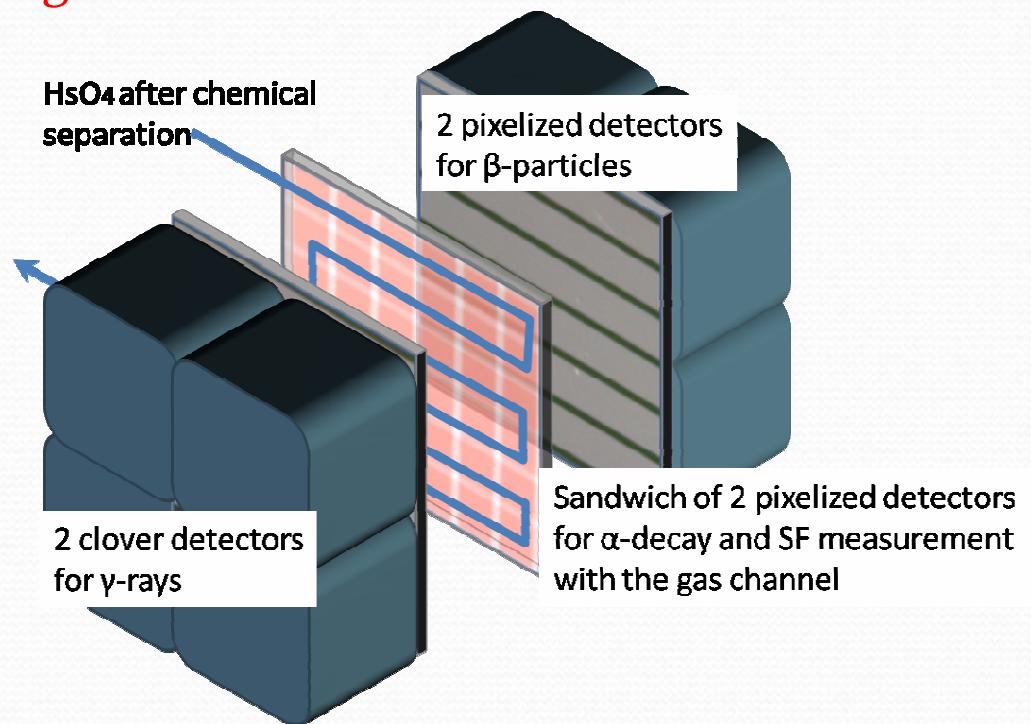

Ch. E. Düllmann and A. Türler  
Phys. Rev. C 77, 064320 (2008)

# Decay spectroscopy after chemical separation

TASCA + Hs chemistry allow background free measurement!

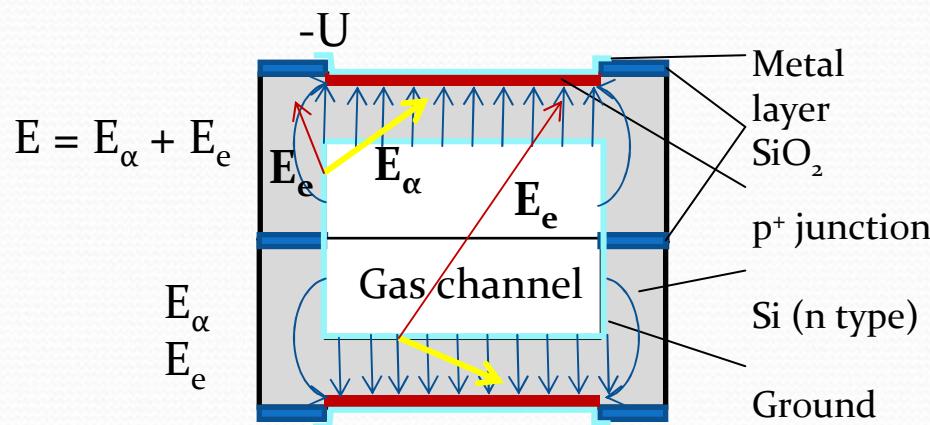

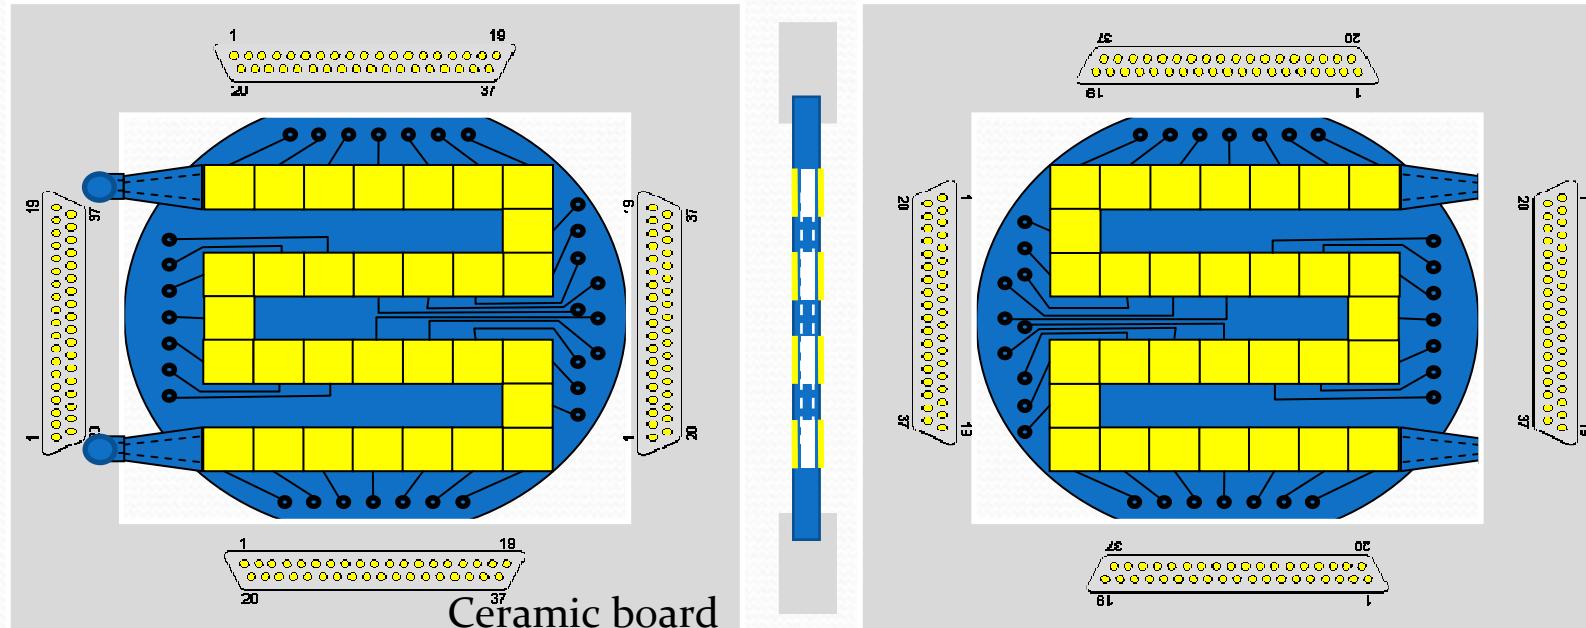

$^{26}\text{Mg} + ^{248}\text{Cm}$  vs.  $^{48}\text{Ca} + ^{226}\text{Ra}$ :

- beam & target
- cross section
- TASCA and RTC efficiencies

Measurement of alpha decay (or SF) in coincidence with conversion electrons and photons

# Pixelized Si sandwich detector

TASCA'08 workshop, 31.10.2008, GSI Darmstadt  
A. Yakushev/Hs spectroscopy @ TASCA

~ 100% efficiency  
for  $\alpha$  and SF detection  
(under development now)

# Single sided silicon strip detector

First prototypes of DSSD and SSD detectors developed for the new TASCA FPD have been manufactured in Warsaw and tested in Dubna

Large internal  
conversion coefficients →

Measurement of conversion  
electrons is important!!

SSD structure:

48 x 72 mm, 8 strips

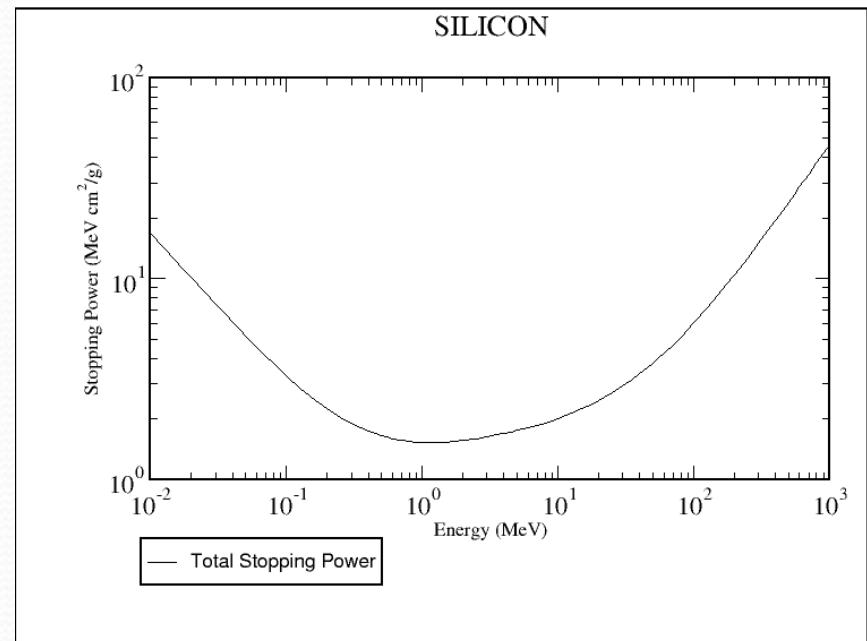

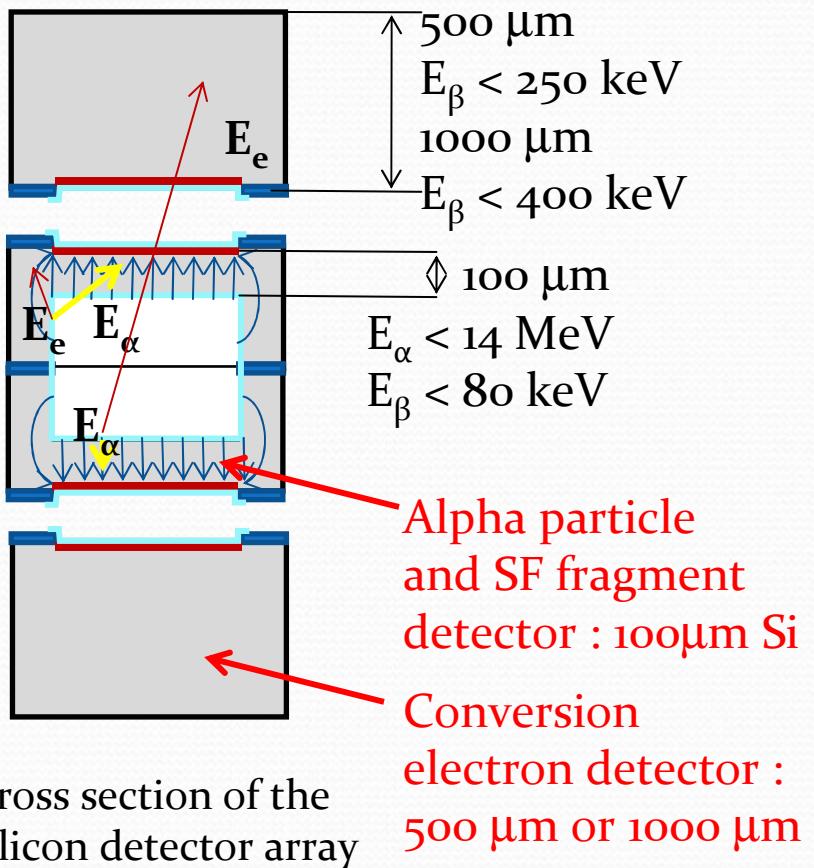

Thickness 500  $\mu\text{m}$

Full depleted @ -50 V

$\beta$  resolution 8 keV @ 356 keV  
(w/o cooling)

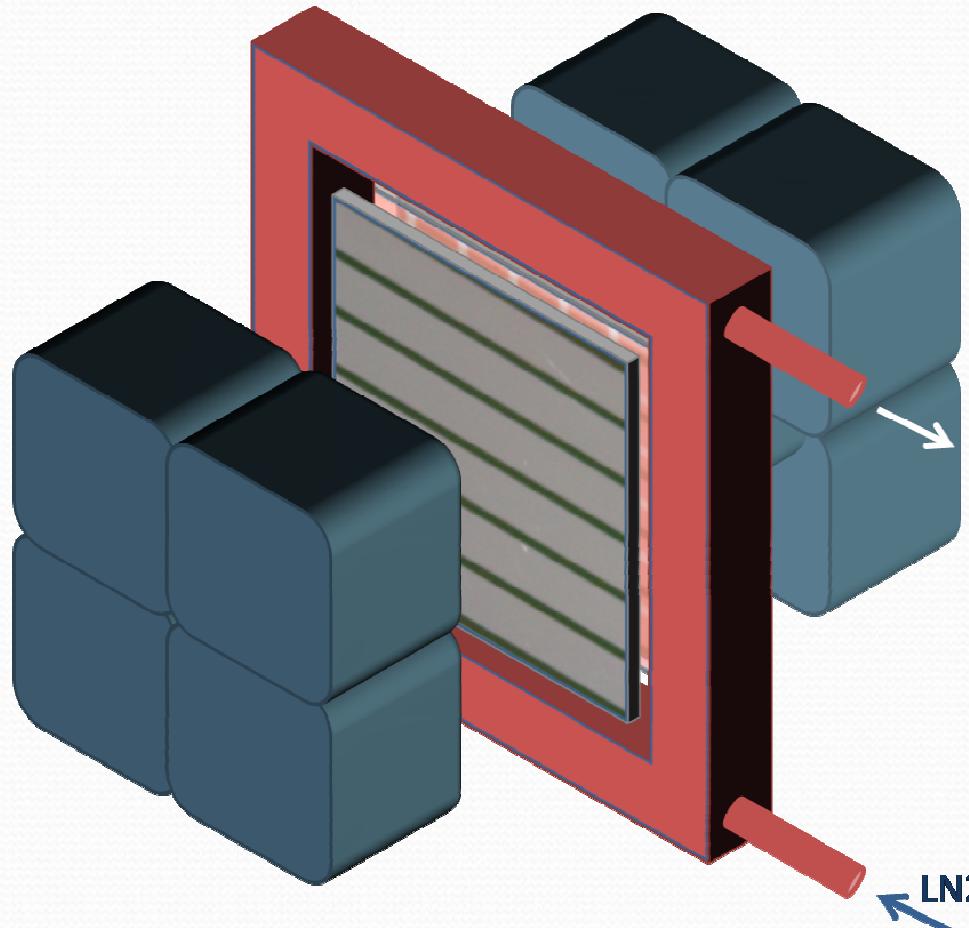

Mounting on ceramic or PCB

# How thick should be detectors for detection of alpha particles and conversion electrons

Total stopping power of electrons in silicon

# Detector for Alpha-Beta-Gamma Spectroscopy - ALBEGAS

Si array  $\sim 70 \times 70 \text{ mm}^2$  active area consists of :

- „sandwich“ detector with  $2 \times 32$  single diodes
- thick strip detector for conversion electrons

Array is cooled down to  $\sim -100 \text{ }^\circ\text{C}$

„ALBE“ part will be provided by TU Munich group

+ 2 clover detectors  $\sim 100 \times 100 \text{ mm}^2$  can be provided by GSI

# Conclusion

- Decay spectroscopy of Hs isotopes and their daughters under background free conditions is possible
- Very high detection efficiency for  $\alpha$ ,  $\beta$  and  $\gamma$  decays
- Silicon detectors are under development now
- The best nuclear reaction for  $^{269}\text{Hs}$  production has to be chosen taking into account efficiency of TASCA
- One detected decay chain every day
- Two or three weeks of the beam time is needed to get statistics
