-3.8	-17.69	-16.74	19.49
-5		0 counts	

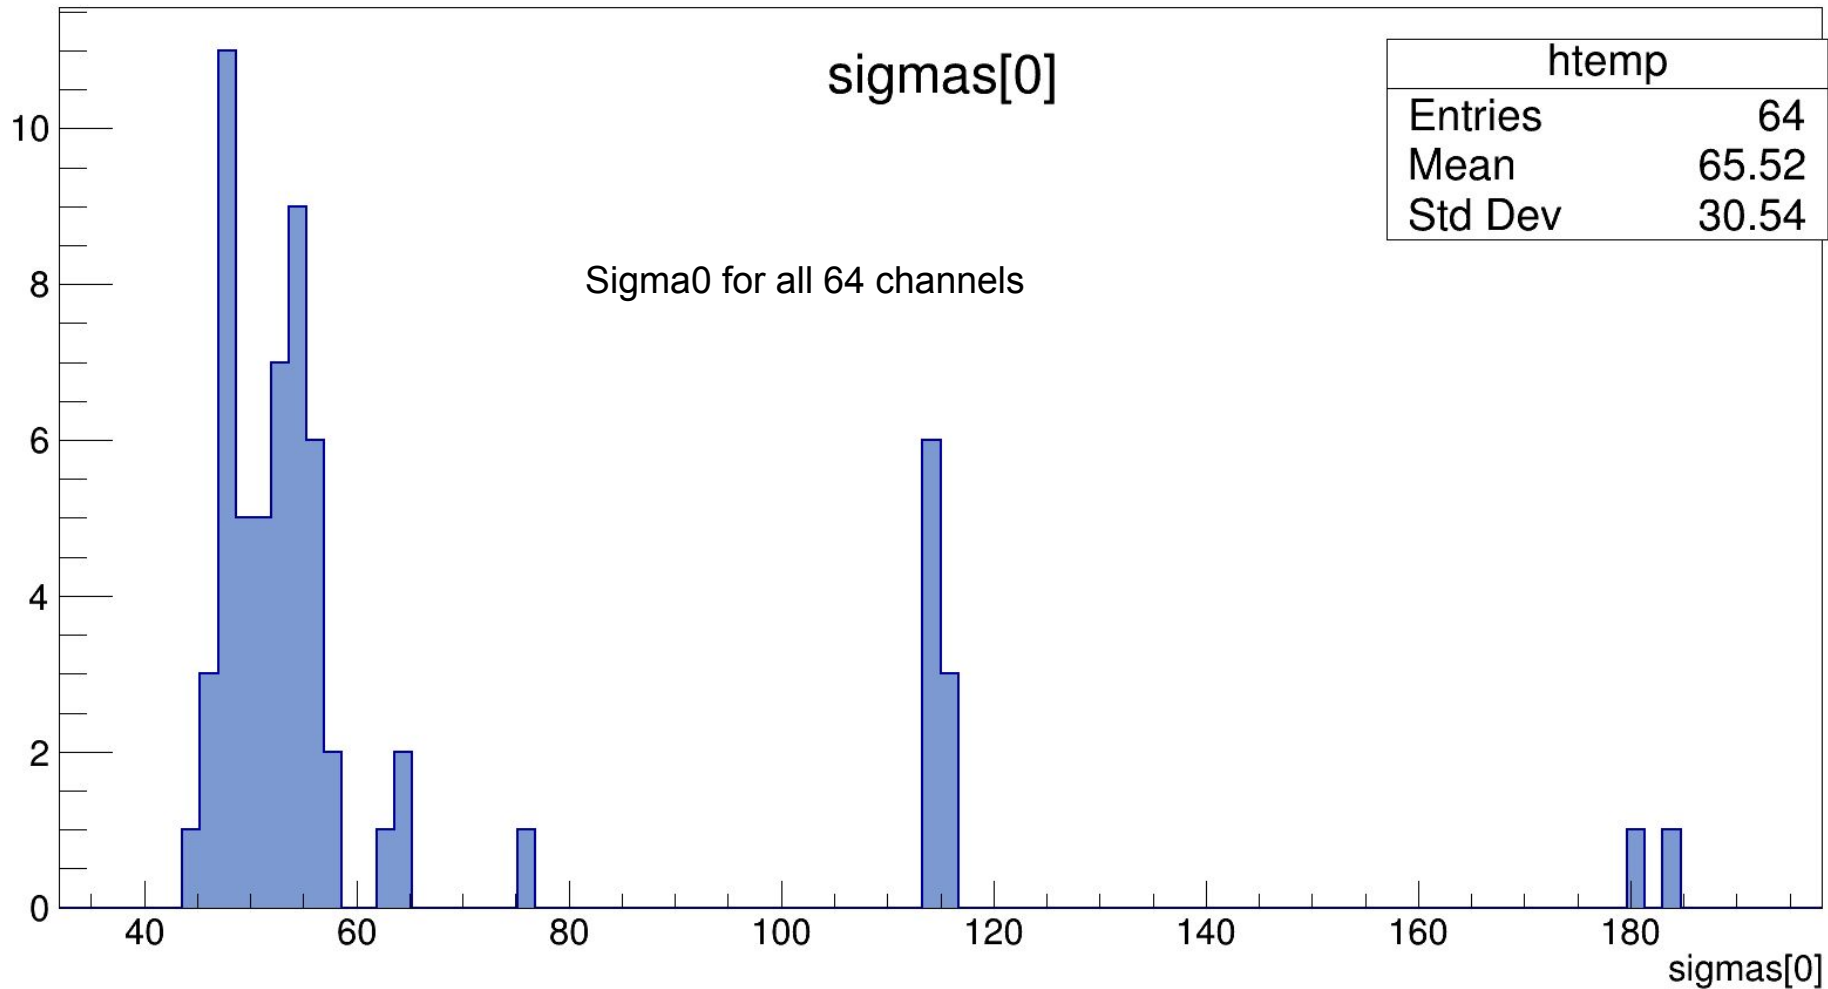

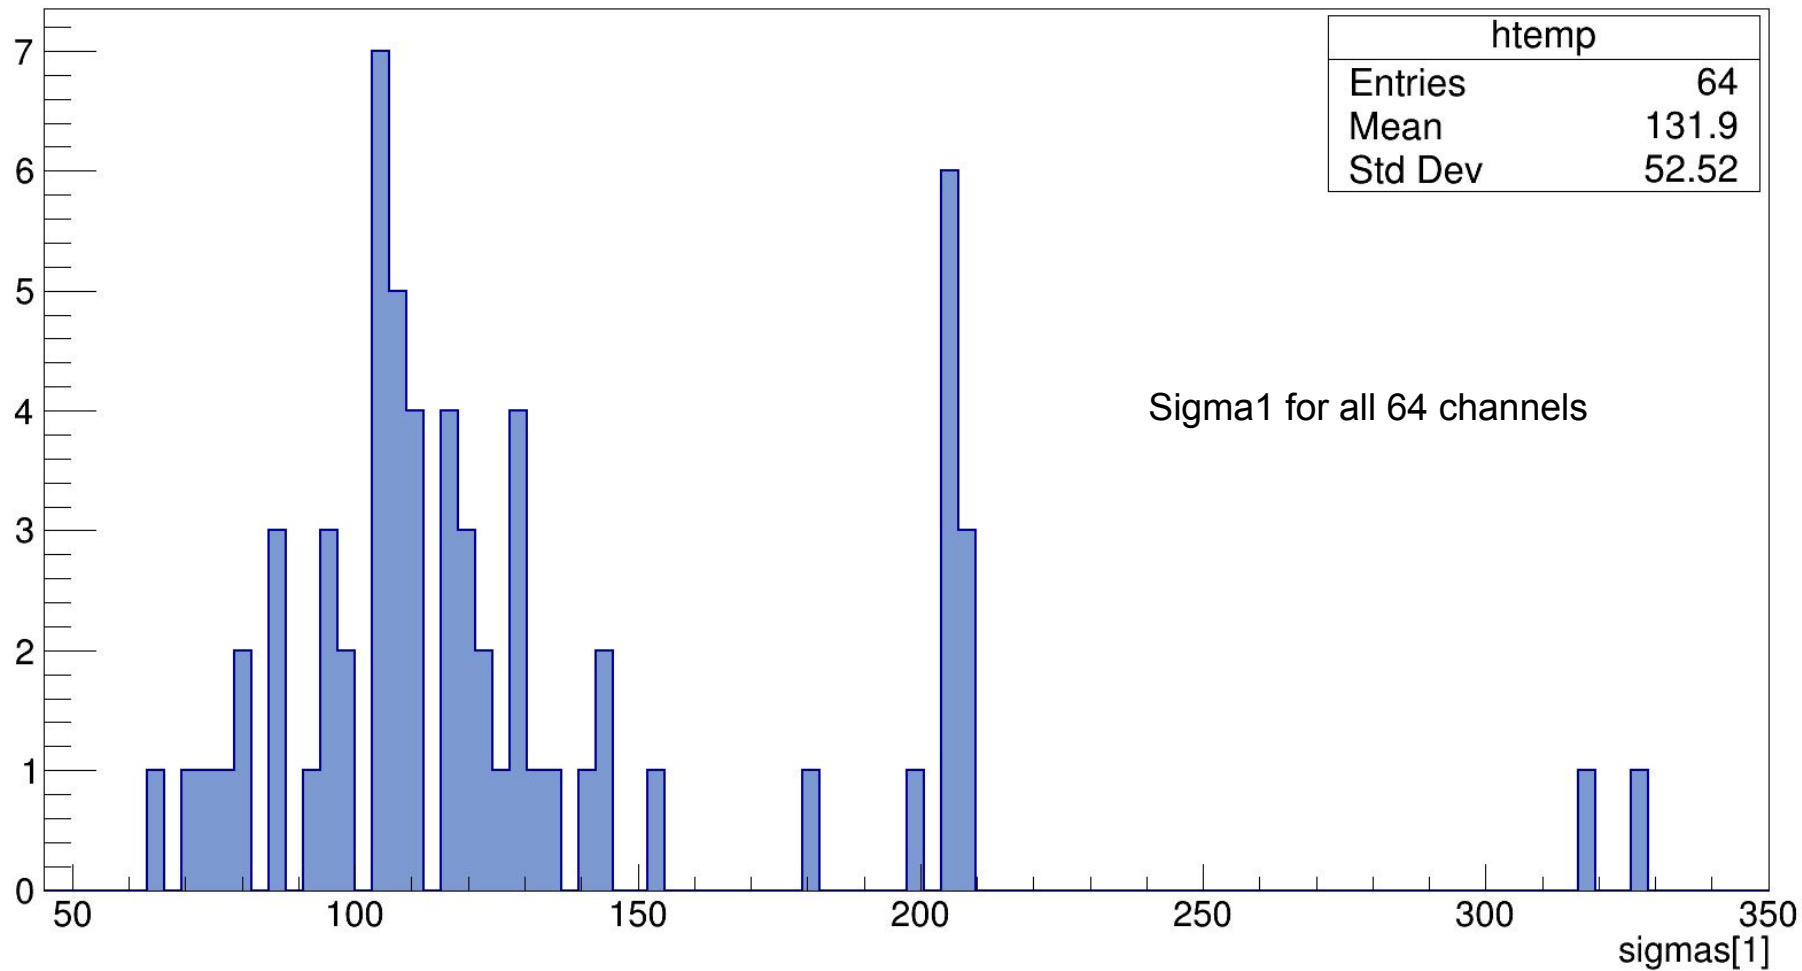

- Higher CE of Photonis comes with a price: more collected recoil electrons → worse time resolution (especially RMS!)
- Solution: increase of HV between PC and MCPin → shift of recoil peak into the main peak → better TTS (σ) and RMS (-0.5...2 ns)
- RMS timing improves by a factor 2 – 3

Photonis 9002193 with different voltage dividers, from 1:10:1 (PC-MCPin:MCPin-MCPout:MCPout-Anode) to 4:10:1
