

The neutrino mass experiment KATRIN

GSI-FAIR Colloquium, GSI-FAIR, Darmstadt, April 25, 2023

Christian Weinheimer – Institute for Nuclear Physics, University of Münster

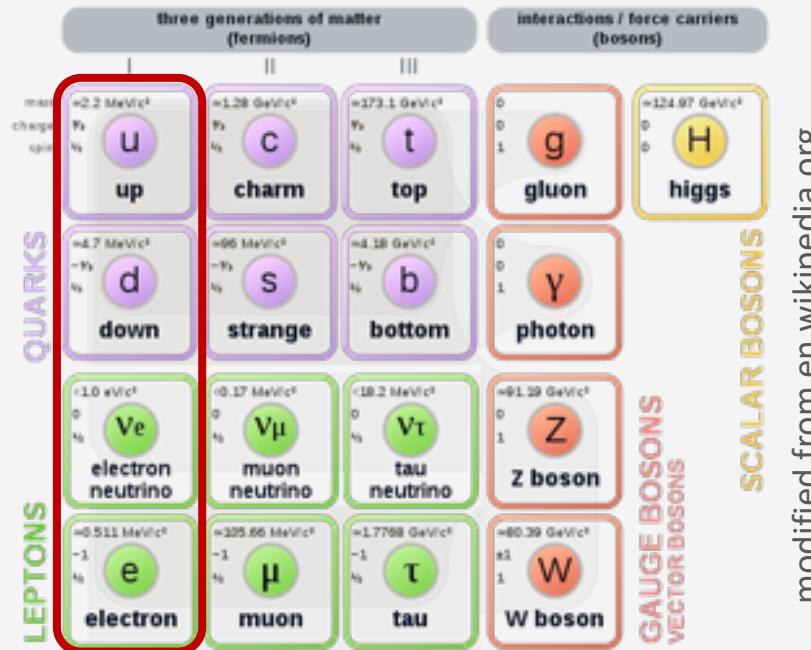

- Introduction – search for $m(\nu)$
- The direct neutrino mass experiment KATRIN
- Recent sub-eV results from KATRIN
- Improvements and future goals of KATRIN
- Conclusions

Happy birthday, Jürgen Kluge !

Neutrinos in the Standard Model of particle physics

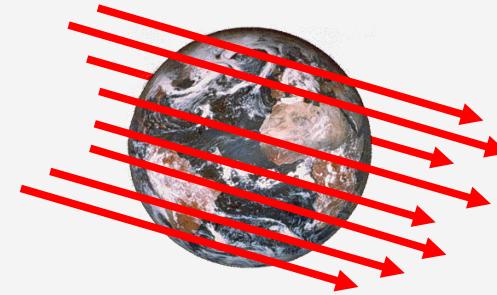

Standard Model of Elementary Particles

Neutral, spin $\frac{1}{2}$,
Only weak interaction (W,Z very heavy):

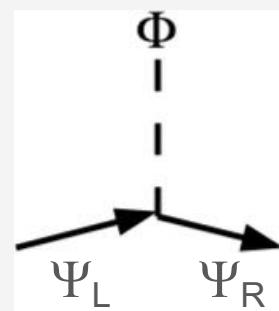

$\lambda_\nu \approx \text{light years at MeV scale}$

interaction rate increases linearly with E_ν usually

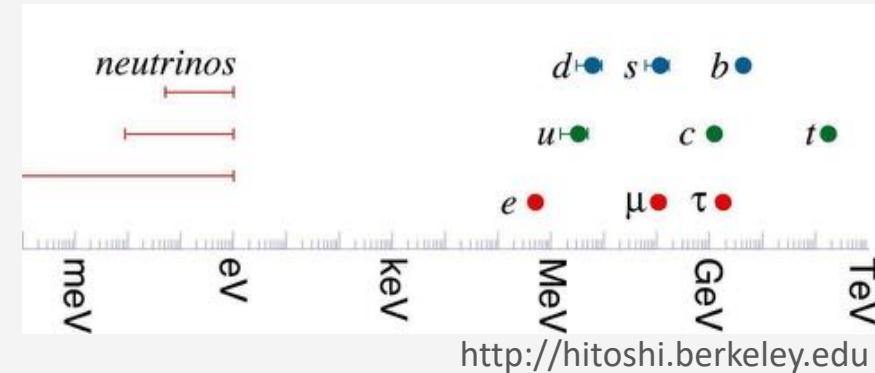

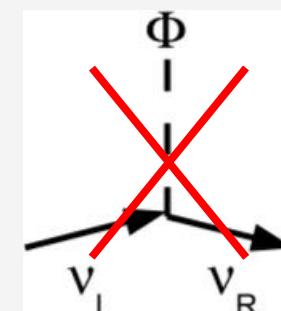

The most abundant particle in the universe:

Cosmic neutrino background: $336 / \text{cm}^3$ (similar to CMB photons)

In original SM ν only left-handed: ν_L
→ difficult to account for mass term:

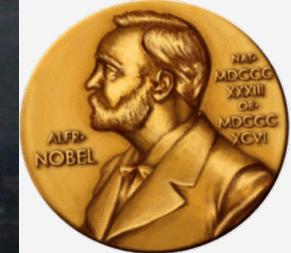

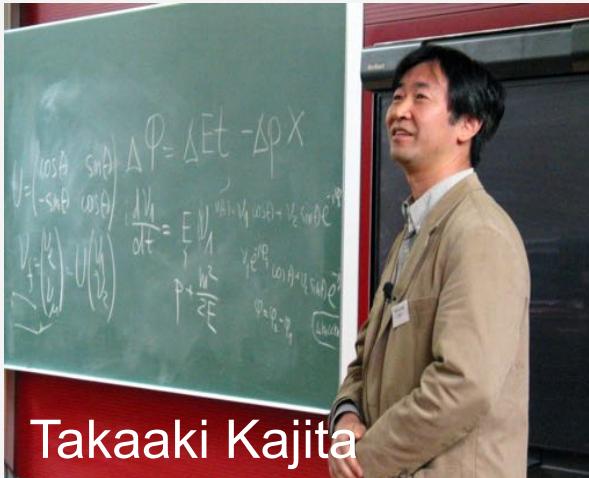

Yukawa coupling to the Higgs
did not exist in the SM up to 1998

Discovery of neutrino oscillations $\rightarrow m(\nu) \neq 0$

Super Kamiokande experiment (1998)

atmospheric neutrinos: $\nu_\mu \rightarrow \nu_\tau$

Sudbury Neutrino Observatory SNO (2001/02)

solar neutrinos: $\nu_e \rightarrow \nu_\mu / \nu_\tau$

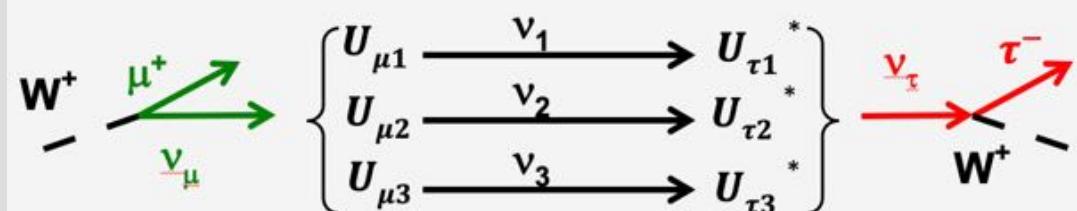

Nobel Prize
in physics 2015

Neutrino oscillation:

3 flavor ν_e, ν_μ, ν_τ & 3 mass eigenstates ν_1, ν_2, ν_3
mixed by a unitary 3×3 matrix U_{PMNS}

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \end{pmatrix} = U_{PMNS} \cdot \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \end{pmatrix}$$

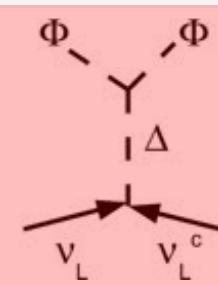

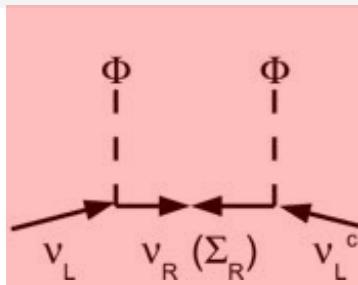

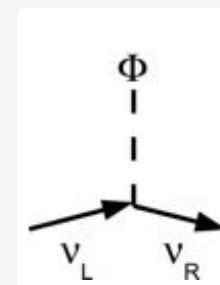

\rightarrow „tripple slit“ exp.: solar $\nu_e \rightarrow \nu_\mu, \nu_\tau$, atmospheric $\nu_\mu \rightarrow \nu_\tau$

Motivations to search for the neutrino mass scale

Why are so neutrinos so light compared to the other fermions in the Standard Model of particle physics?

The very small neutrino masses are probably due to more than just the Yukawa coupling to the Higgs

“Seesaw”-mechanism

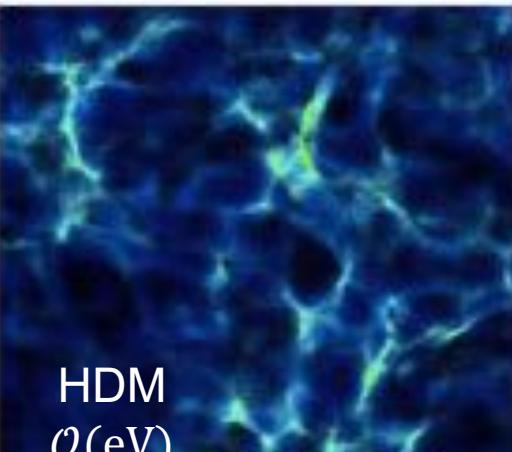

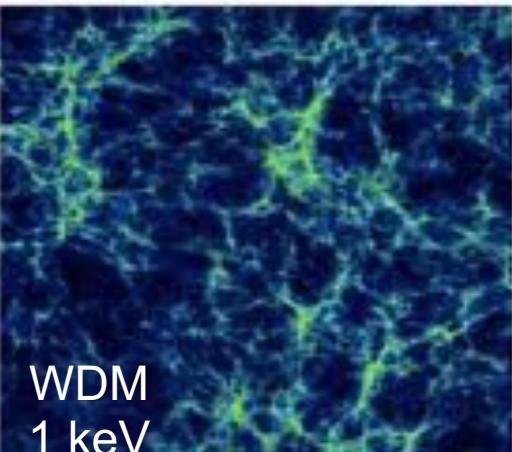

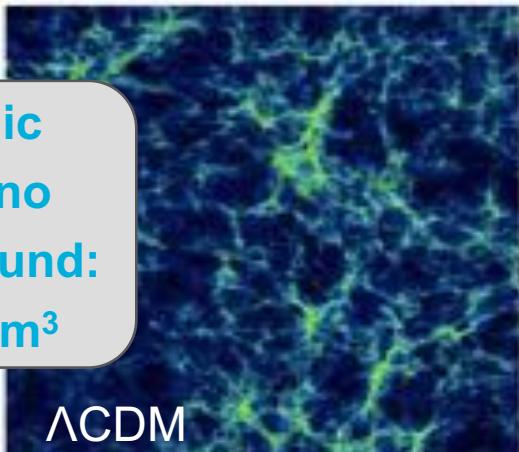

**Physics beyond the
Standard Model
at very large energy scales**

How do the neutrinos influence the evolution of the universe?

Even small neutrino masses count, since a billion times more neutrinos than atoms in the universe

**Cosmic neutrino background:
336 / cm³**

Λ CDM

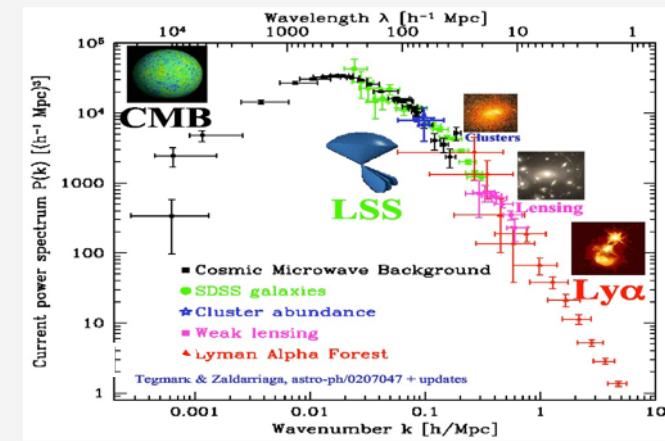

**Structure formation
in the early universe:
depending on their mass
neutrinos had smeared out
different scales**

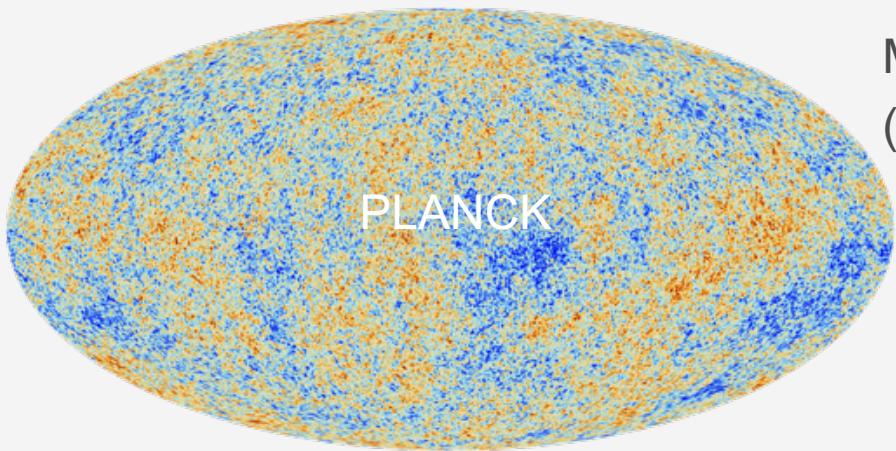

Three complementary ways to the absolute neutrino mass scale

1) Cosmology: $\sum_i m(\nu_i) = 3 \cdot \overline{m(\nu_i)}$

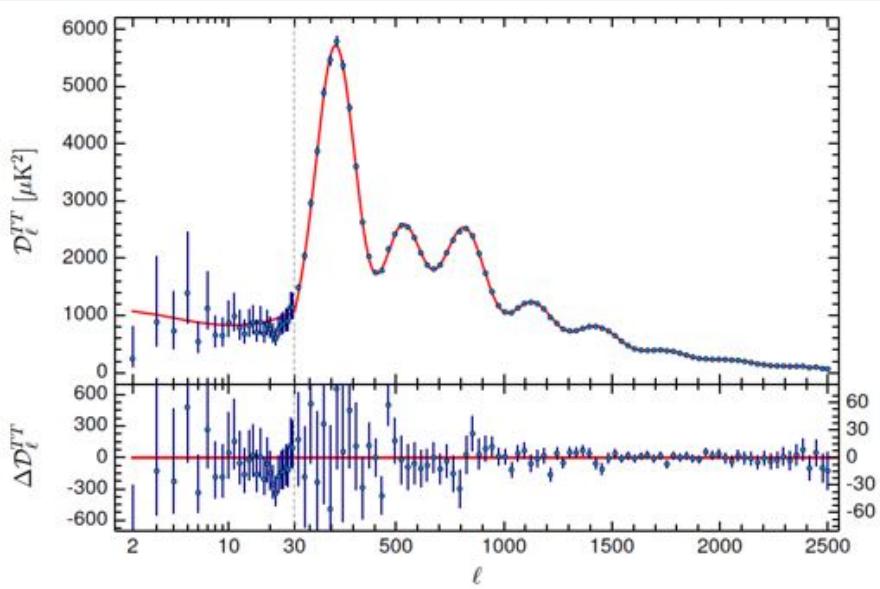

very sensitive, but model dependent, compares power at different scales

Neutrino mass from cosmology

Measurement of CMB
(Cosmic Microwave Background radiation)

Planck Collaboration:
P. A. R. Ade et al., arXiv:1502.01589

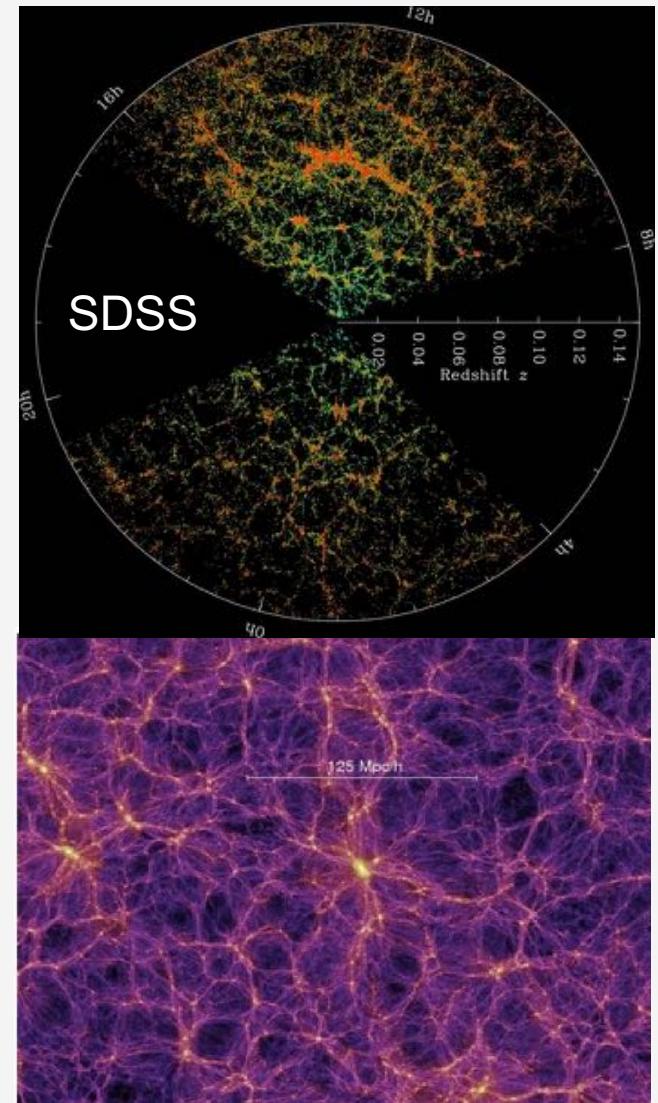

Measurement of matter
density distribution LSS
(Large Scale Structure)
by 2dF, SDSS, ...

Compare to numerical models
including relic neutrino density
of 336 cm^{-3}

→ within the Λ CDM model:

$$\sum m(\nu_i) < 0.12 \text{ eV}$$

Planck Collaboration, A&A 641, A6 (2020)

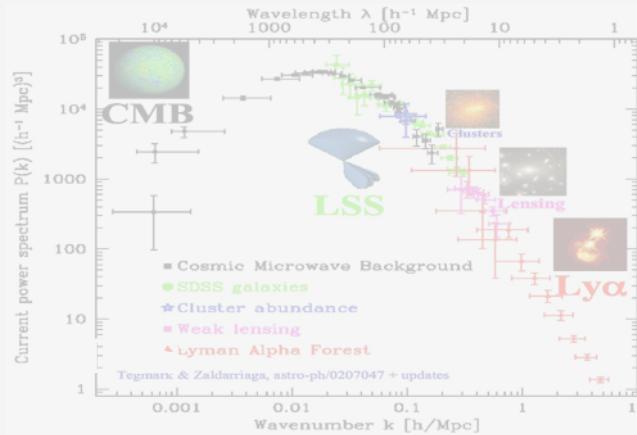

Millenium simulation

<http://www.mpa-garching.mpg.de/galform/presse/>

Three complementary ways to the absolute neutrino mass scale

1) Cosmology: $\sum_i m(\nu_i) = 3 \cdot \overline{m(\nu_i)}$

very sensitive, but model dependent, compares power at different scales

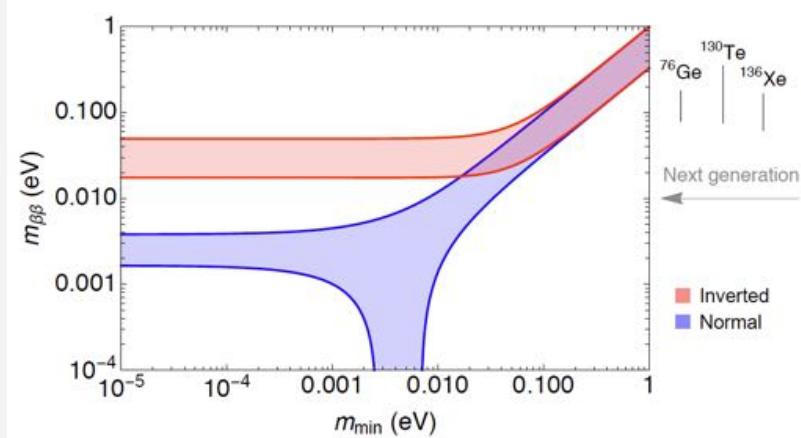

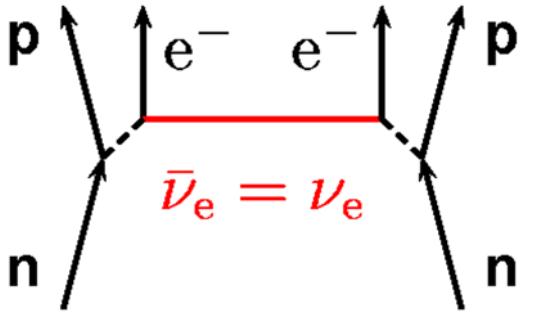

2) Search for 0νββ: $m_{\beta\beta} := |\sum_i U_{ei}^2 \cdot m(\nu_i)|$

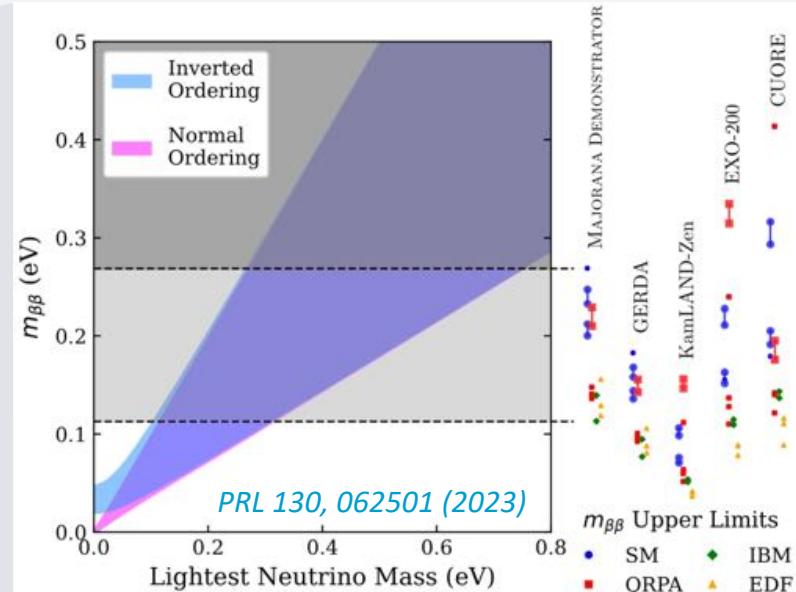

sensitive to Majorana neutrinos only, challenge of uncertainties of nuclear matrix elements

disclaimer: $m_{\beta\beta}$ are valid only, if 0νββ works dominantly via ν exchange

Discovery of 0νββ would proof lepton number violation !

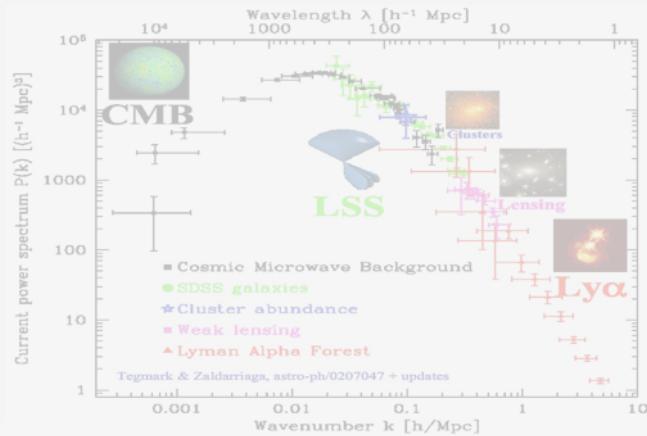

log → lin
scale

Three complementary ways to the absolute neutrino mass scale

1) Cosmology: $\sum_i m(\nu_i) = 3 \cdot \overline{m(\nu_i)}$

very sensitive, but model dependent, compares power at different scales

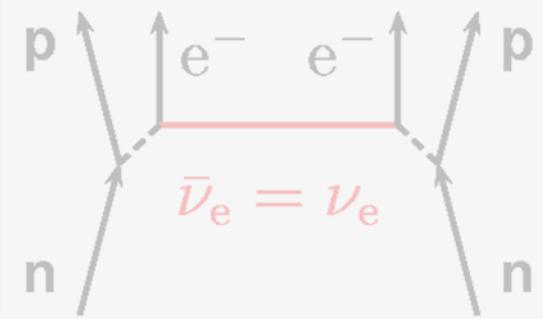

2) Search for $0\nu\beta\beta$: $m_{\beta\beta} := |\sum_i U_{ei}^2 \cdot m(\nu_i)|$

sensitive to Majorana neutrinos only, challenge of nuclear matrix elements

disclaimer: $m_{\beta\beta}$ are valid only, if $0\nu\beta\beta$ works dominantly via ν exchange

Discovery of $0\nu\beta\beta$ would proof lepton number violation !

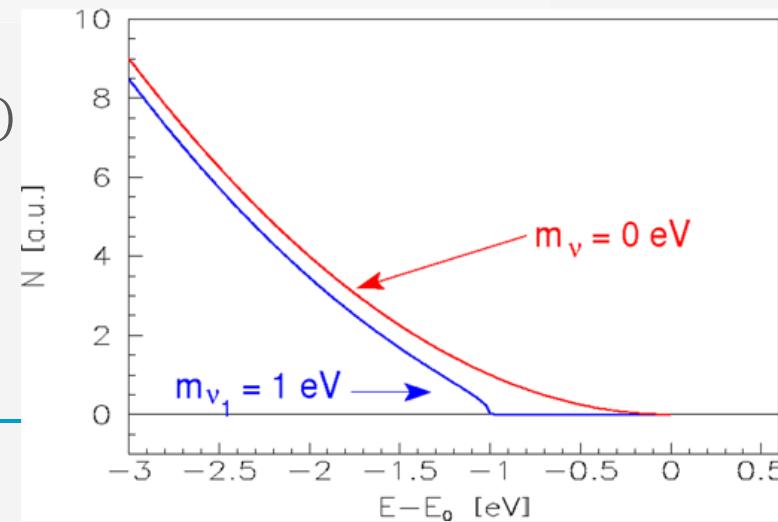

3) Direct neutrino mass determination: $m^2(\nu_e) := m_\beta^2 := \sum_i |U_{ei}|^2 \cdot m^2(\nu_i)$

no further assumptions needed, use $E^2 = p^2c^2 + m^2c^4 \rightarrow m^2(\nu)$

Time-of-flight measurements (ν from supernova)

Kinematics of weak decays / beta decays, e.g. tritium, ^{163}Ho

measure charged decay prod., E-, p-conservation

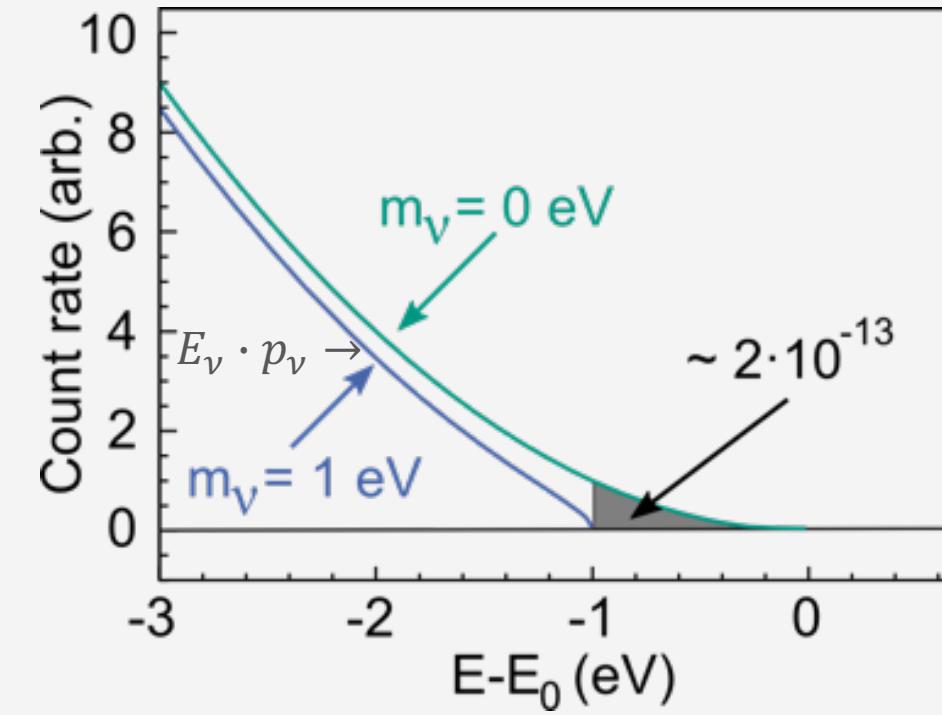

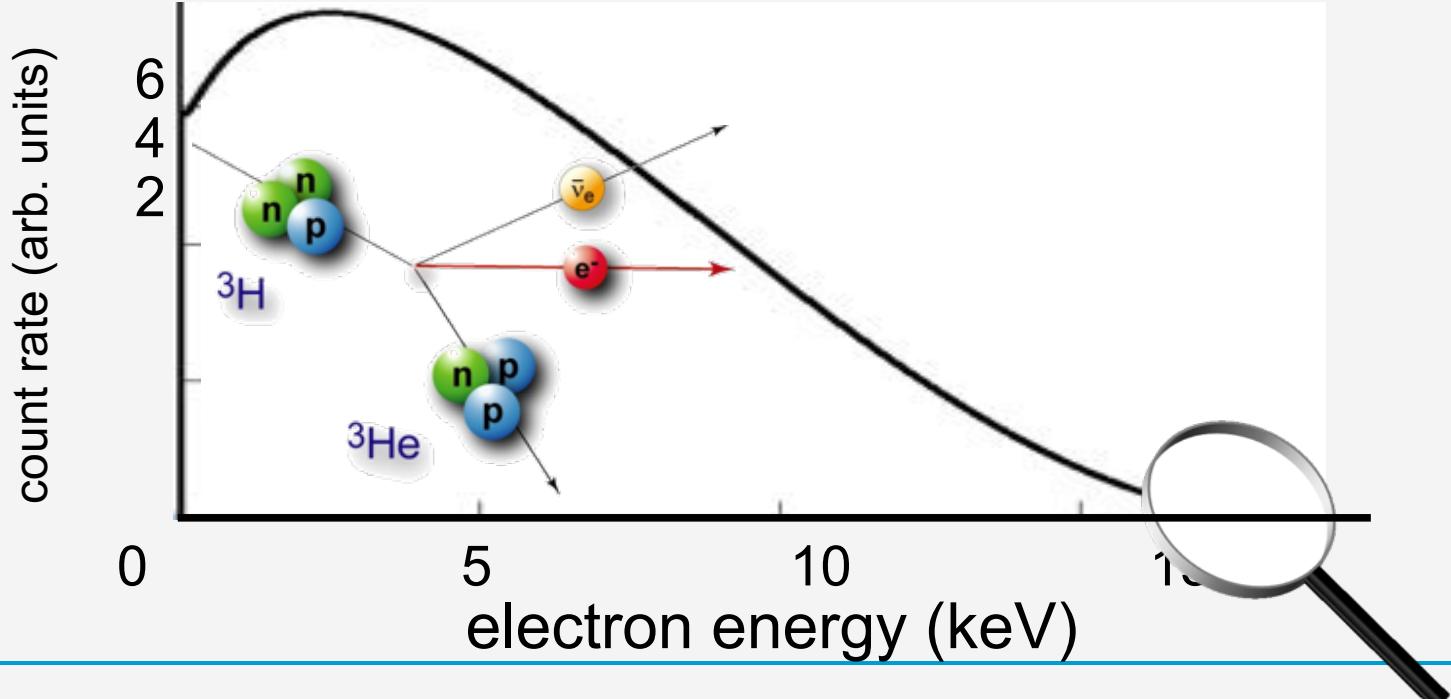

Direct determination of “ $m(\nu_e)$ ” from β -decay (EC)

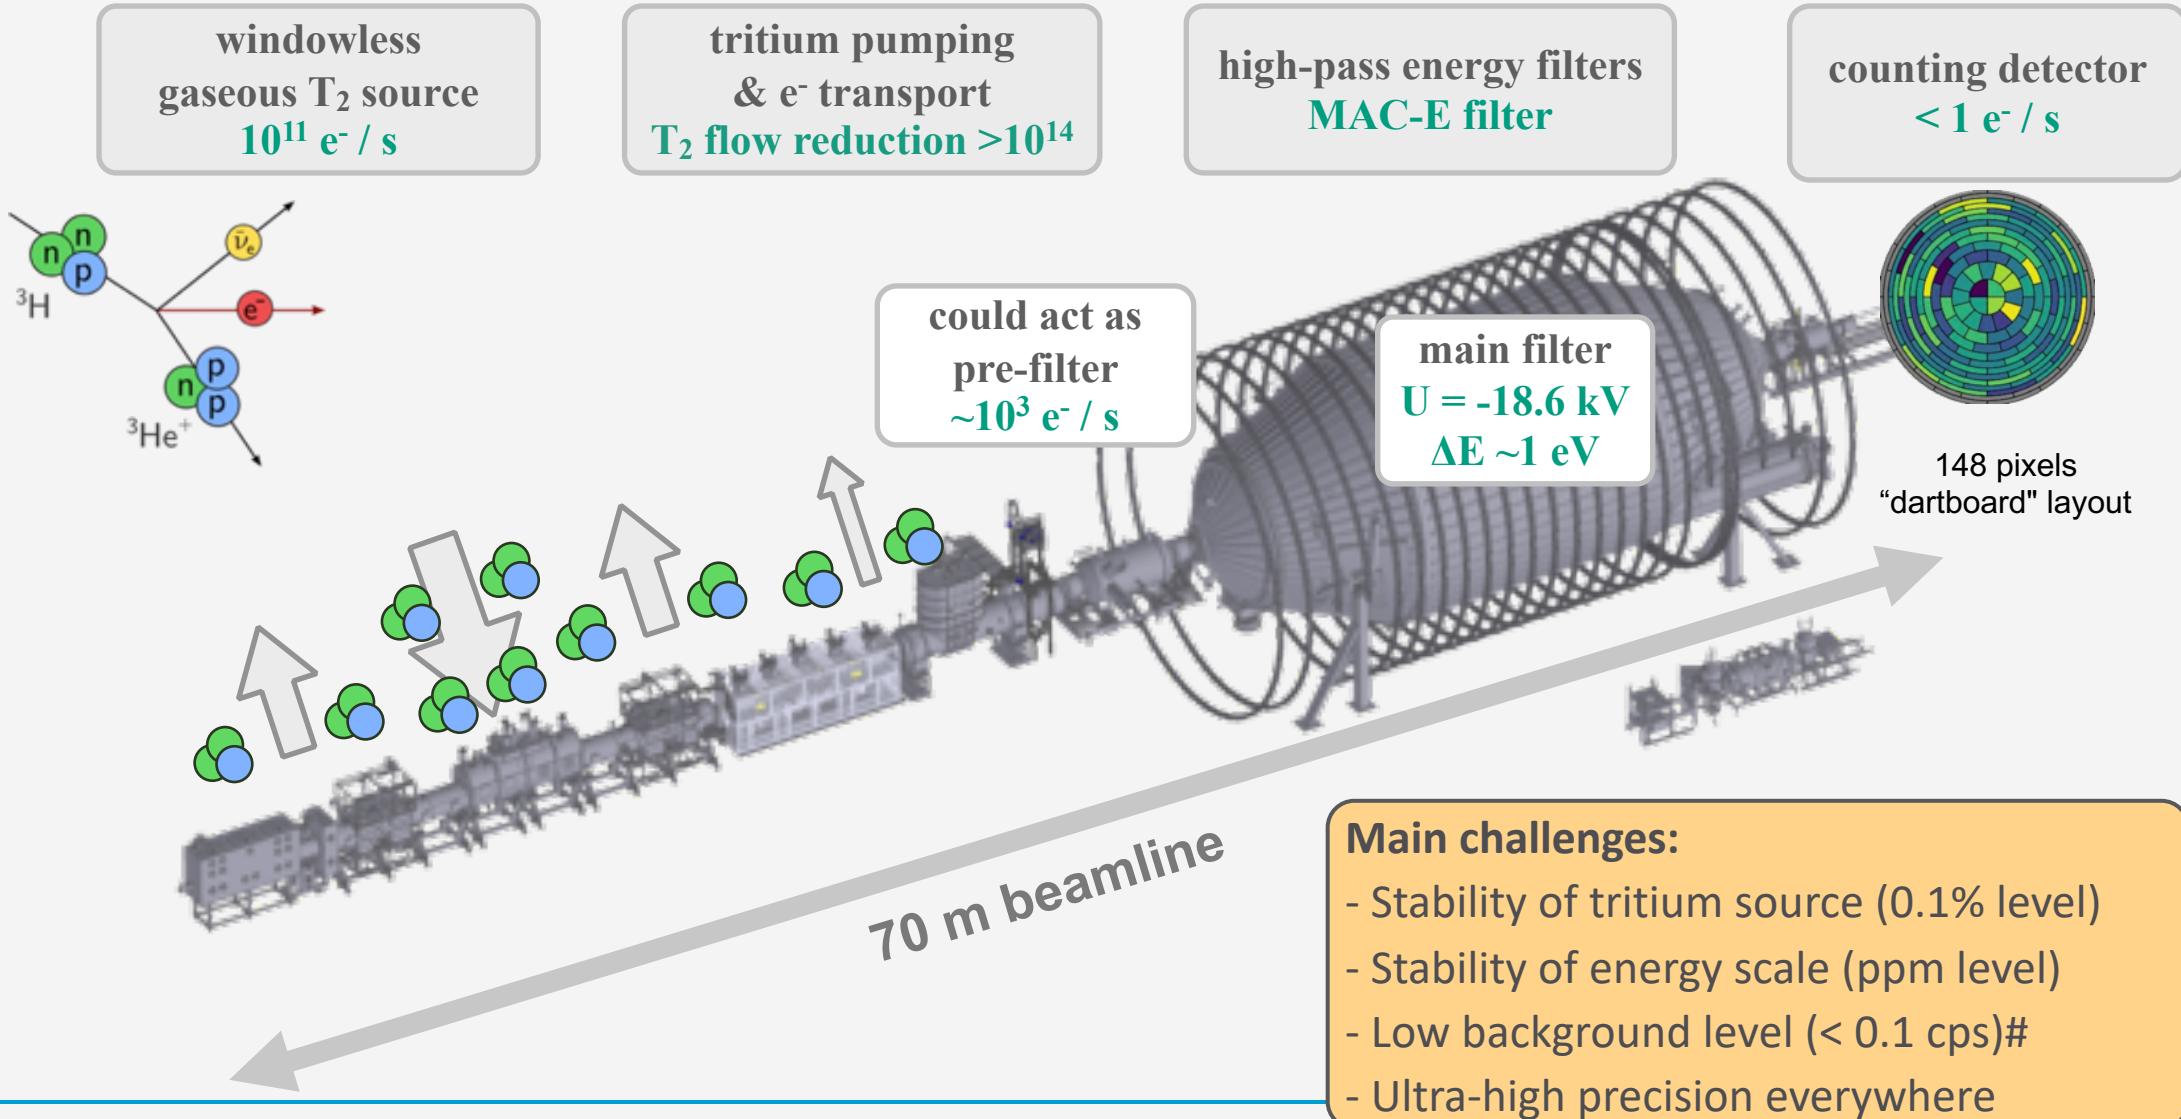

β -spectrum:
$$\frac{dN}{dE} = K \cdot F(E, Z) \cdot p \cdot E_{tot} \cdot (E_0 - Ee) \cdot \sum_i |U_{ei}|^2 \cdot \underbrace{\sqrt{(E_0 - Ee)^2 - m^2(\nu_i)}}_{p_\nu}$$

essentially phase space: $p_e \quad E_e \quad E_\nu \quad p_\nu$

with “electron neutrino mass”: “ $m^2(\nu_e)$ ” := $\sum_i |U_{ei}|^2 \cdot m^2(\nu_i)$, complementary to $0\nu\beta\beta$ & cosmology
 (modified by electronic final states, recoil corrections, radiative corrections)

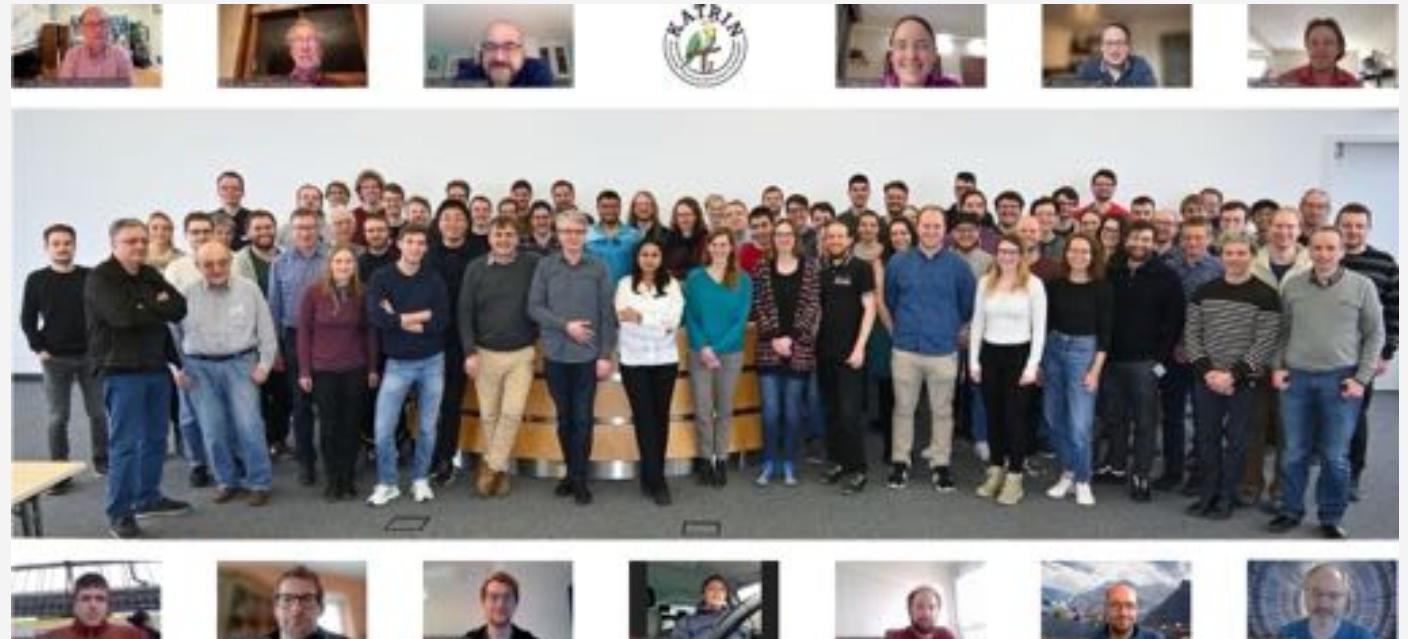

The KArlsruhe TRItium Neutrino experiment KATRIN at Karlsruhe Institute of Technology (KIT)

The KArlsruhe TRItium Neutrino experiment KATRIN

The international KATRIN Collaboration:
150 people
from 24 (8) institutions (countries)

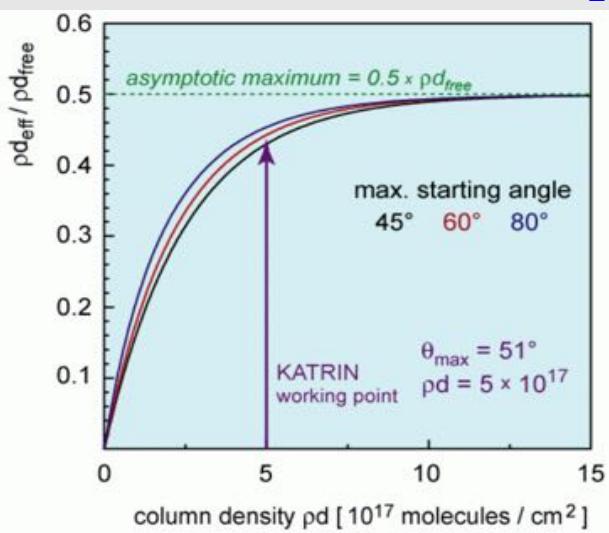

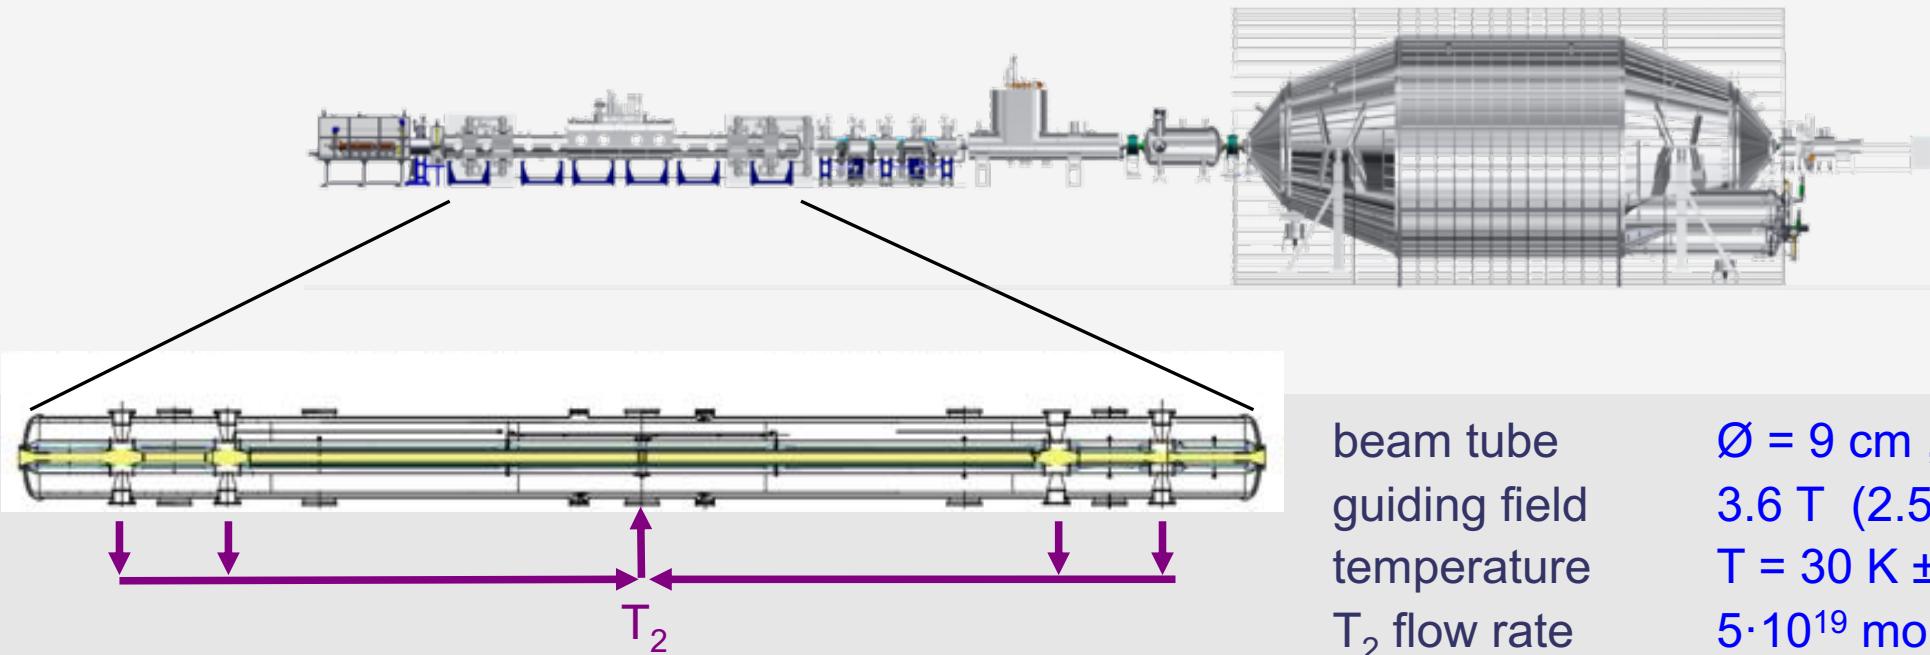

Collaboration Meeting
Spring 2023

Funded by:

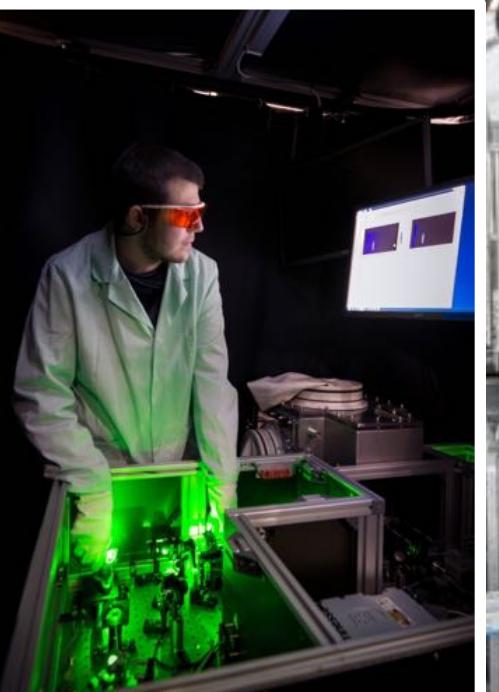

Windowless Gaseous Molecular Tritium Source

WGTS at Tritium Laboratory Karlsruhe

Photos: source & transport section

Main spectrometer: an integrating high resolution MAC-E Filter

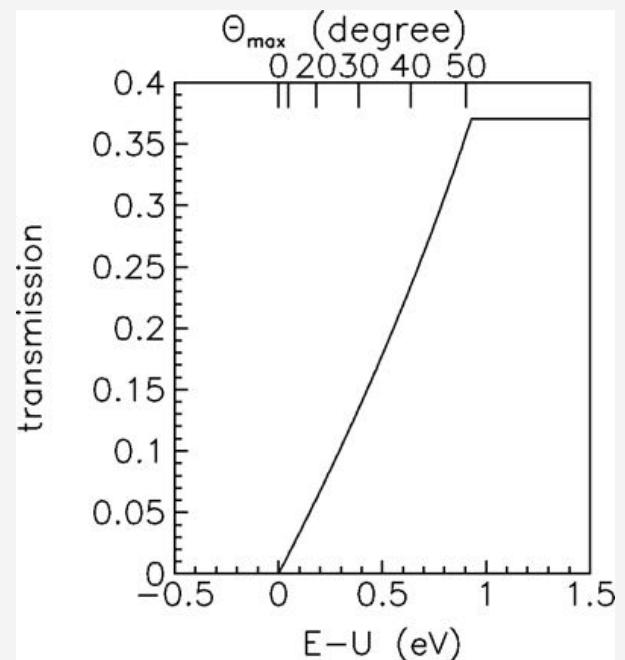

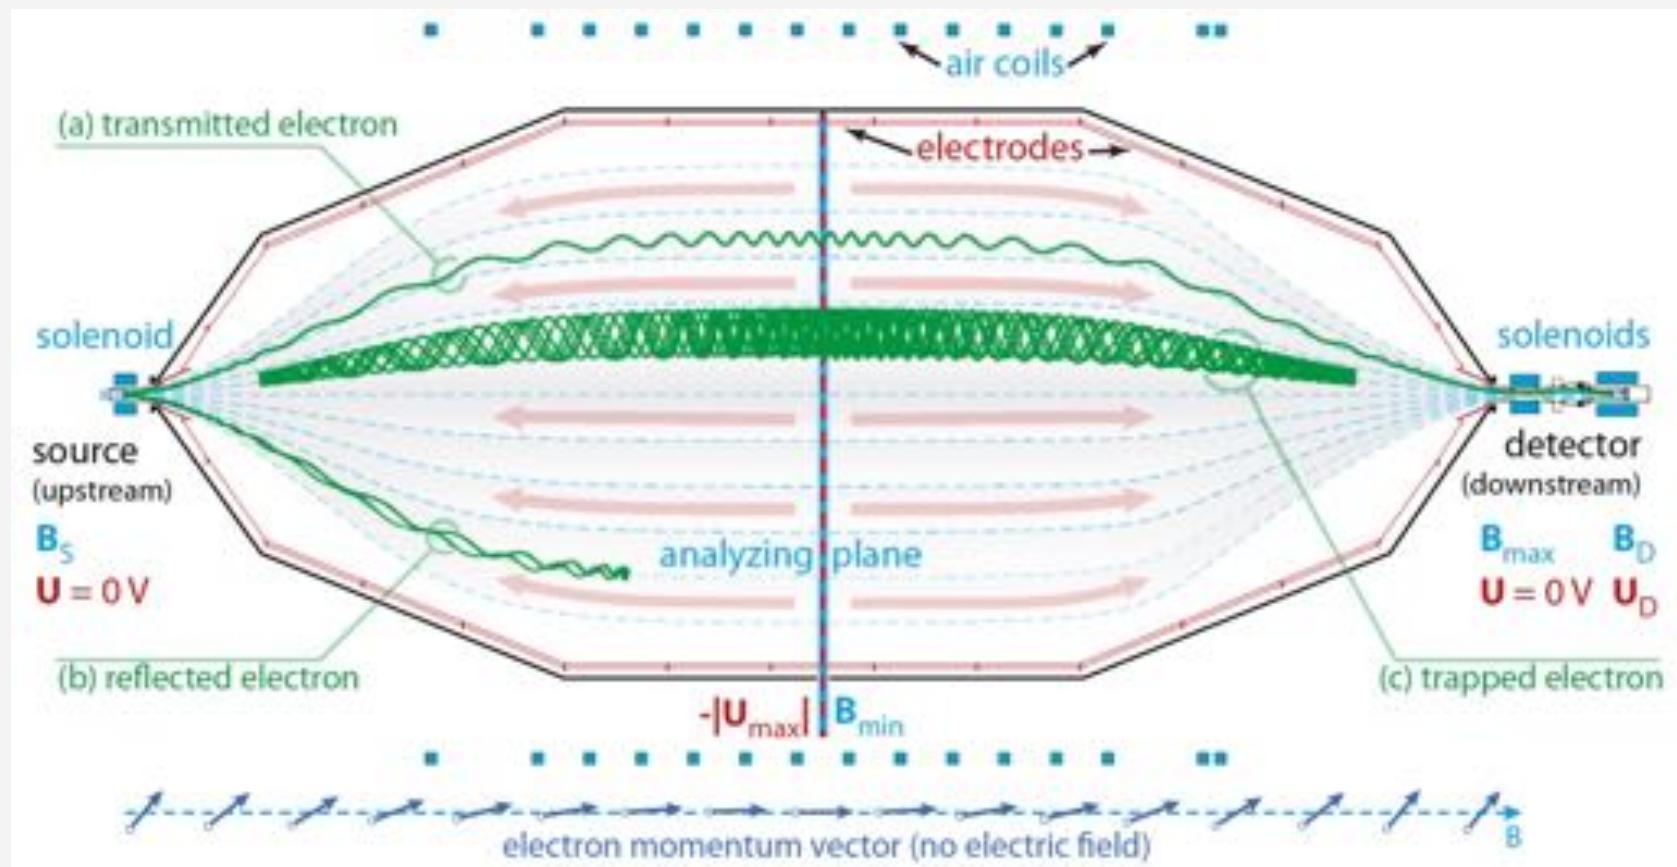

Ultra-high vacuum, pressure $< 10^{-11}$ mbar
Precision retardation voltage of -18.6 kV (ppm)
at vessel (, $\sigma < 60$ mV/years)
and double layer wire electrode system
for background reduction
and field shaping
Air coils for earth magnetic
field compensation

Main spectrometer of MAC-E-filter type

Magnetic gradient force: transforms transversal energy E_{\perp} into longitudinal energy $E_{||}$ ($\frac{E_{\perp}}{B} = \text{const.}$, non-rel.)

Electrostatic filter: retarding voltage U let electrons through above a certain energy $E \sim E_{||} \geq qU$

Very high energy resolution

$$\Delta E = \mathcal{O}(1\text{eV})$$

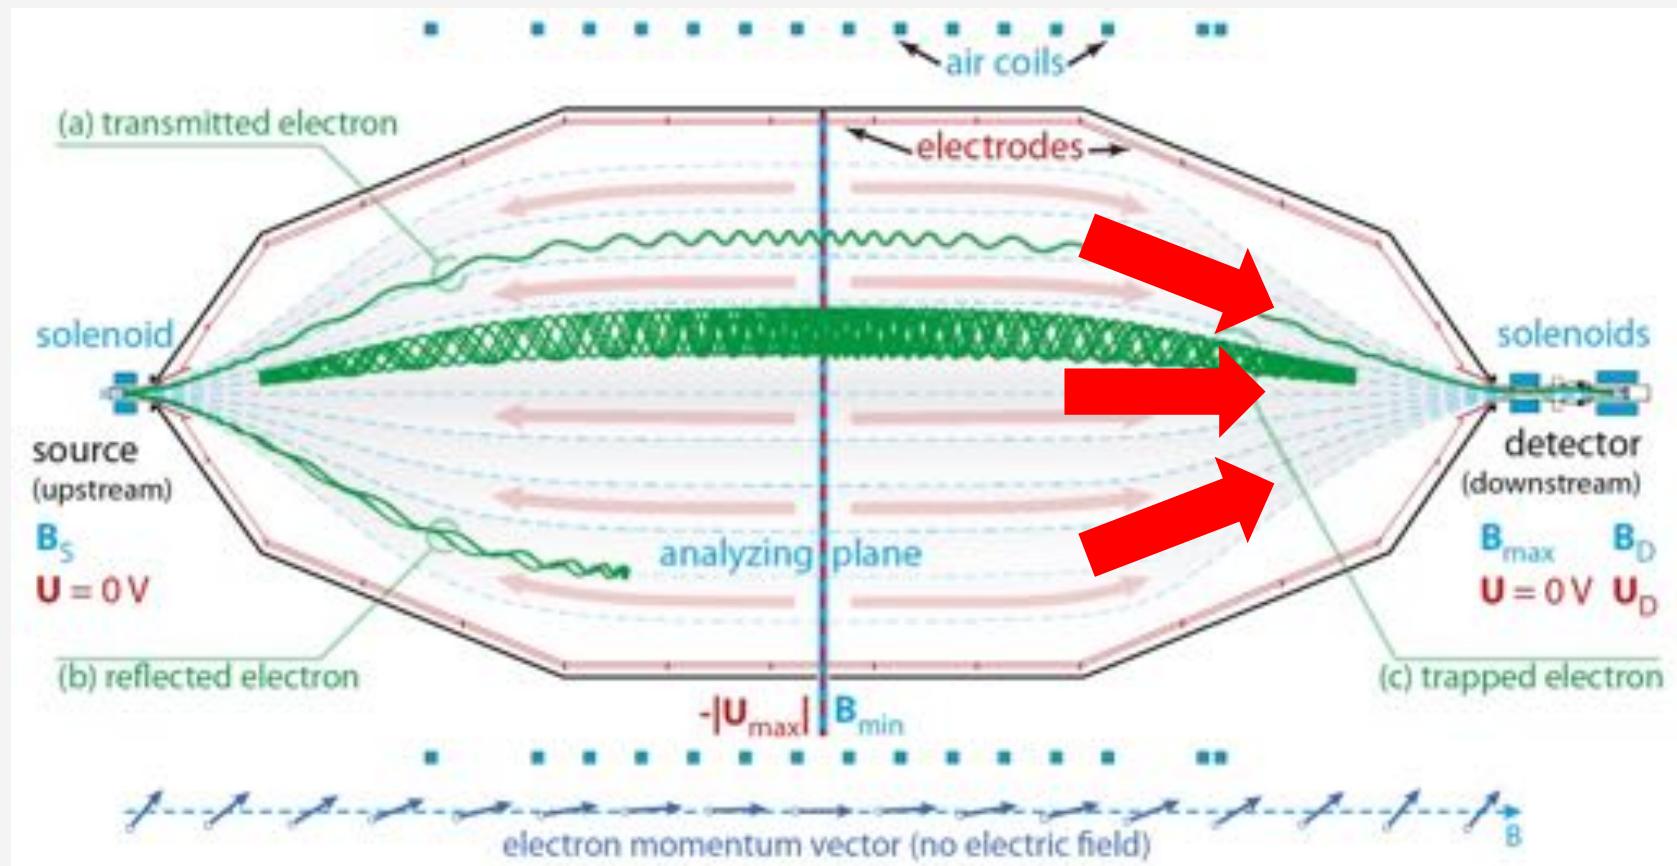

Very high angular acceptance:

$$\Delta\Omega \sim \pi$$

Main spectrometer of MAC-E-filter type

Magnetic gradient force: transforms transversal energy E_{\perp} into longitudinal energy $E_{||}$ ($\frac{E_{\perp}}{B} = \text{const. , non-rel.}$)

Electrostatic filter: retarding voltage U let electrons through above a certain energy $E \sim E_{||} \geq qU$

Sensitive to backgrounds:

- Low energy electrons “born” in the spectrometer volume will be accelerated to detector (same energy as signal electrons)
- Electrons can be trapped in the magnetic bottle of MAC-E-Filter or in local Penning traps → secondary electrons

Very high energy resolution

$$\Delta E = \mathcal{O}(1\text{eV})$$

Very high angular acceptance:

$$\Delta\Omega \sim \pi$$

The KATRIN electron detector FPD

Focal plane detection system

segmented Si PIN diode:

90 mm Ø, 148 pixels, 50 nm dead layer

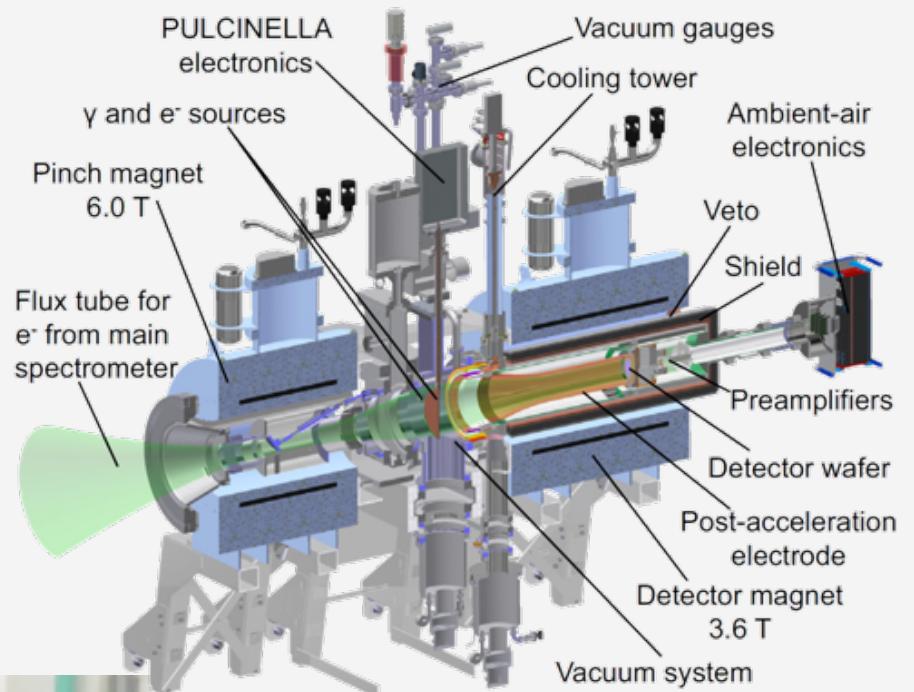

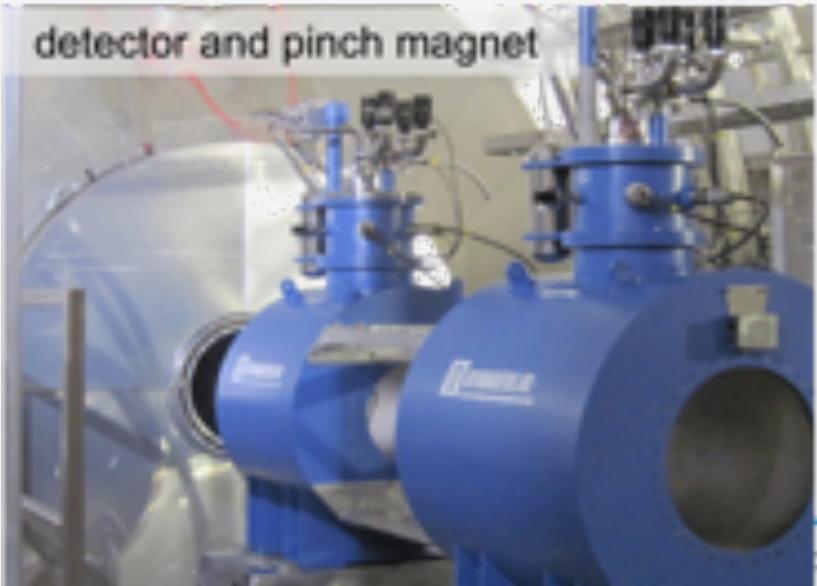

energy resolution ≈ 1 keV

pinch and detector magnets up to 6 T

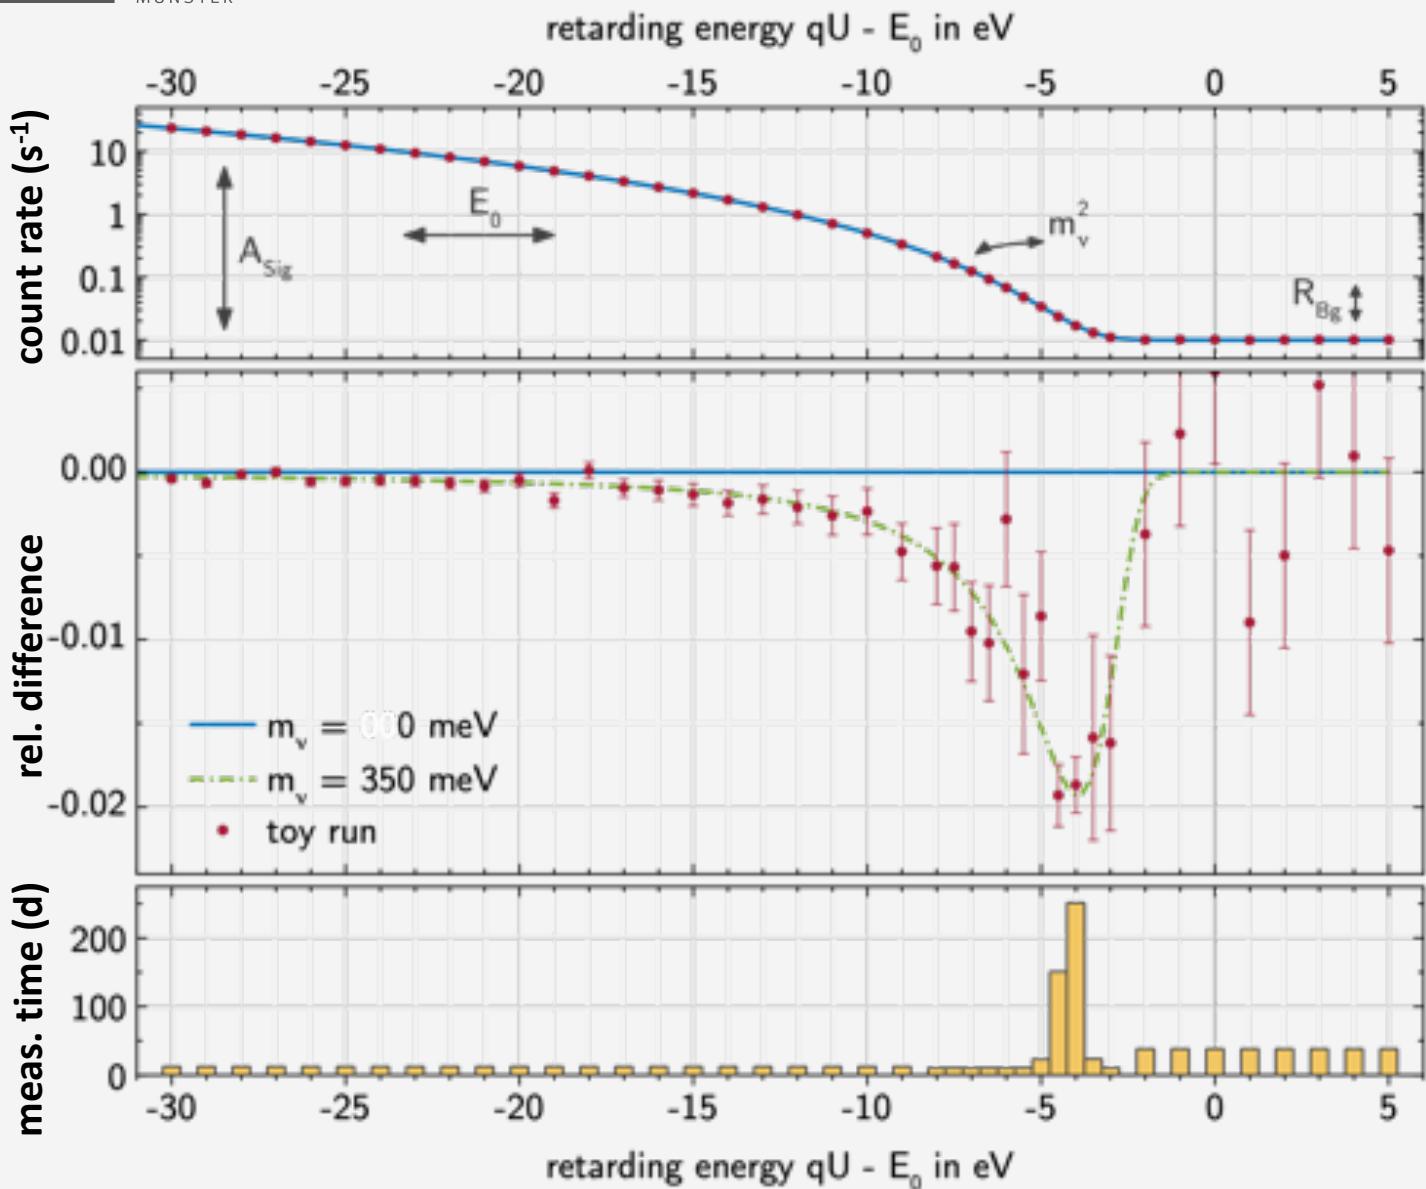

post acceleration (10kV)

active veto shield

detector and pinch magnet

The measurement principle

Direct **shape** measurement of
integral β -spectrum
rate for various **minimal energies qU**
→ essentially 4 fit parameters:

spectrum
norm. A_{sig}

spectrum
endpoint E_0

background
rate R_{Bg}

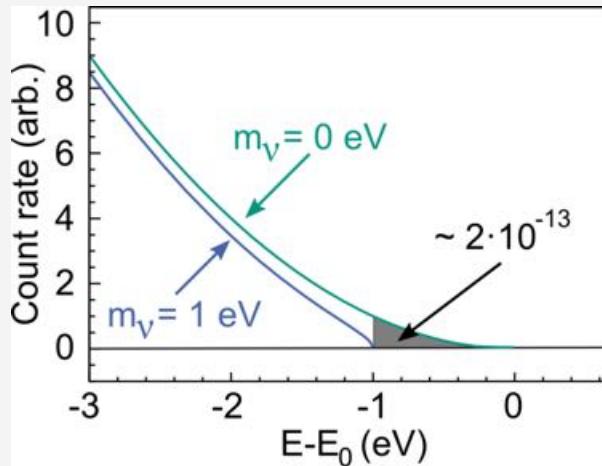

squared
mass m_ν^2

~ 10^{-8} of all β -decays in scan region
~40 eV below endpoint

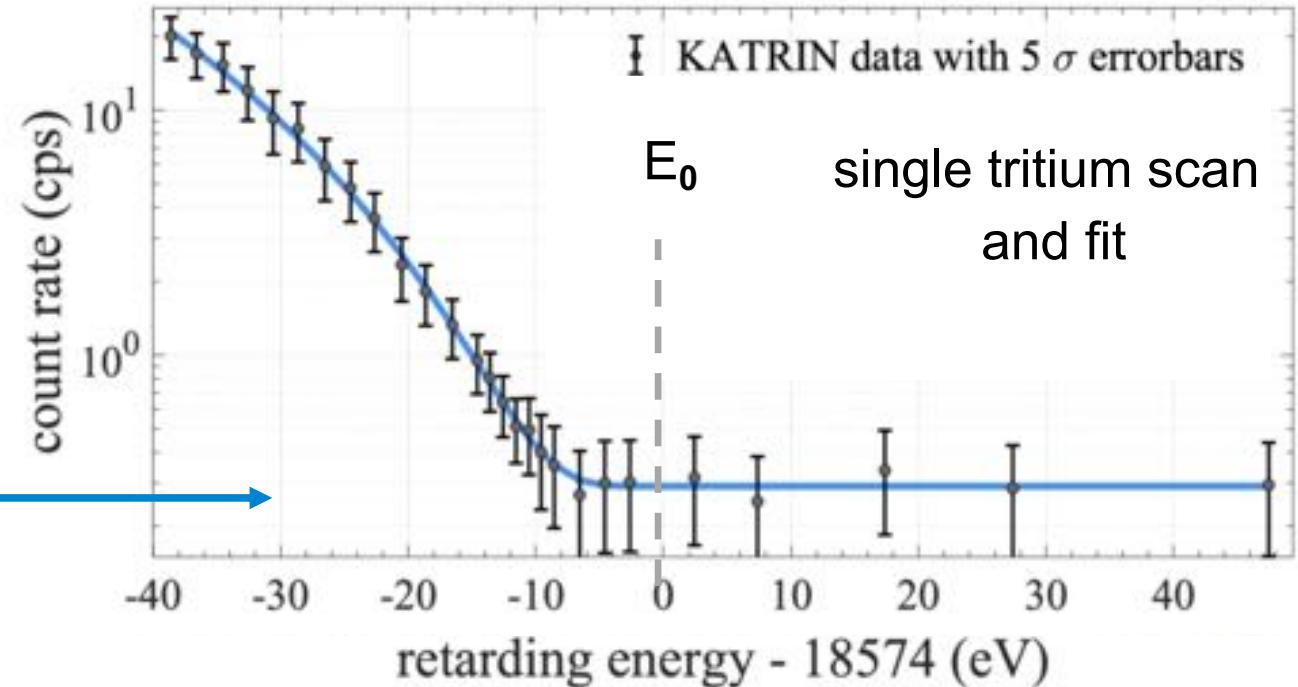

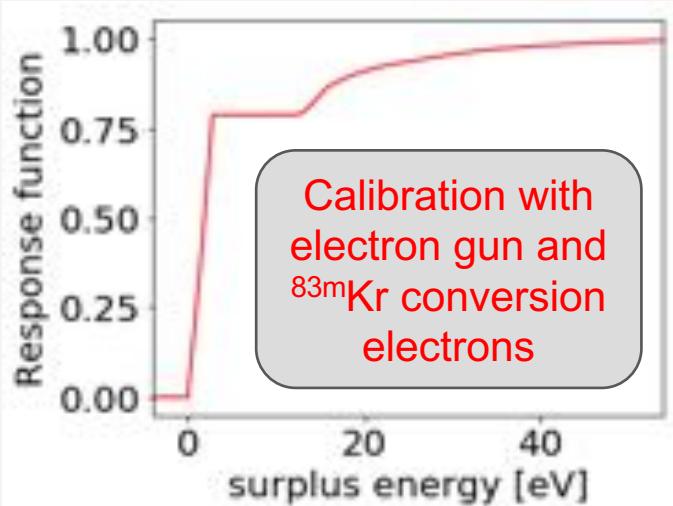

Eur. Phys. J. C 79 (2019) 204

Model of the experimental spectrum

Beta spectrum: $R_\beta(E, m^2(\nu_e))$

Experimental response: $f(E - qU)$

$$R(qU) = A_s \cdot N_T \int_{qU}^{E_0} R_\beta(E, m^2(\nu_e)) \cdot f(E - qU) dE + R_{bg}$$

*PRL 123 (2019) 221802, EPJ C 79 (2019) 204
+ detailed analysis PRD 104 (2021) 012005
+ energy loss measurement EPJ C 81 (2021) 579*

First neutrino mass result

1st science run of KATRIN in spring 2019

- ν -mass: best fit result

$$m^2(\nu_e) = -1.0^{+0.9}_{-1.1} \text{ eV}^2$$

- ν -mass: new upper limit

$$m(\nu_e) < 1.1 \text{ eV (90% C.L. Lokhov – Tkachov)}$$

$m(\nu_e) < 0.8 \text{ eV (90% C.L. Feldman-Cousins)}$

$m(\nu_e) < 0.9 \text{ eV (90% C.L. Bayesian, flat prior } m^2 > 0)$

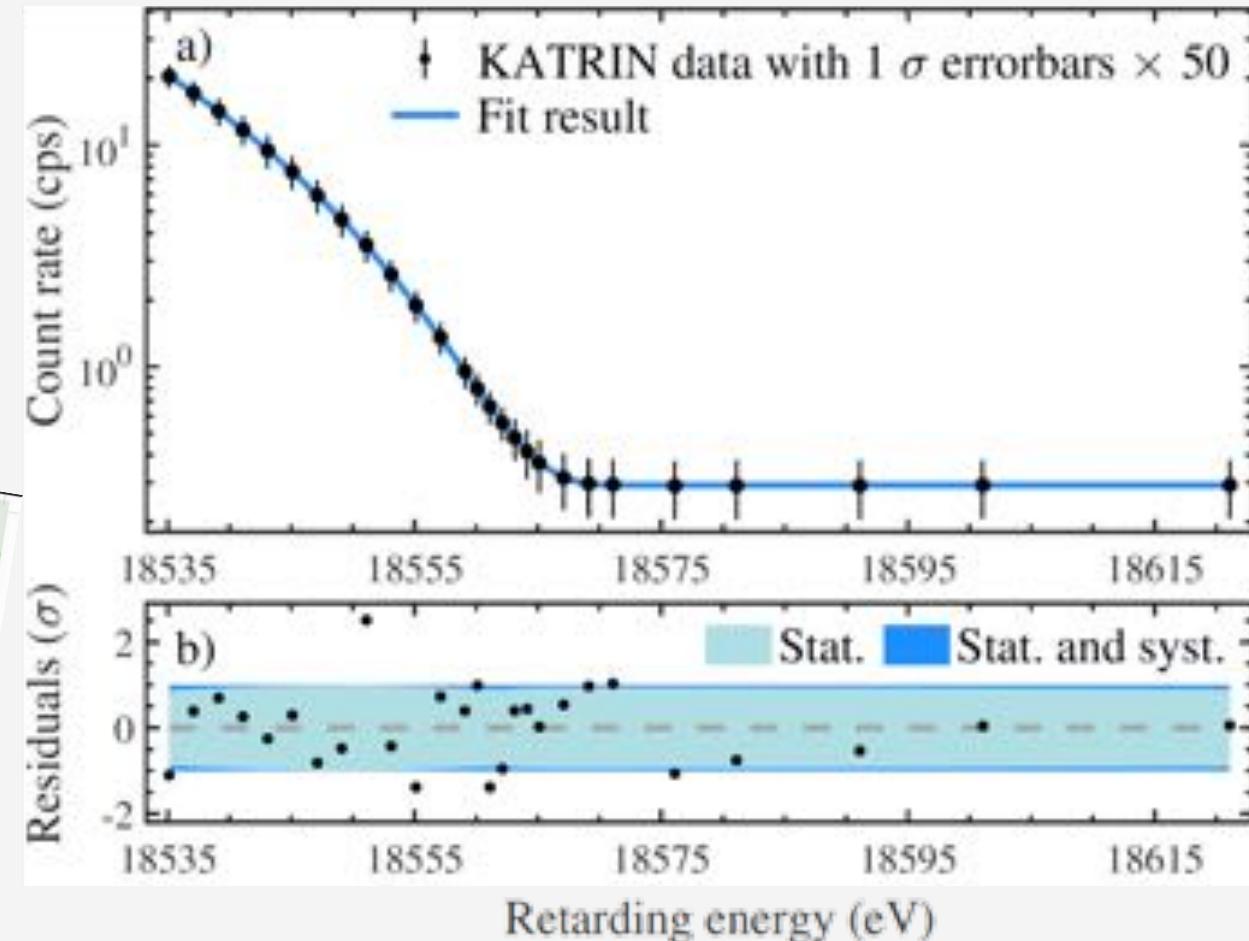

Excellent data quality

Only 9 days out of 1000 live days!

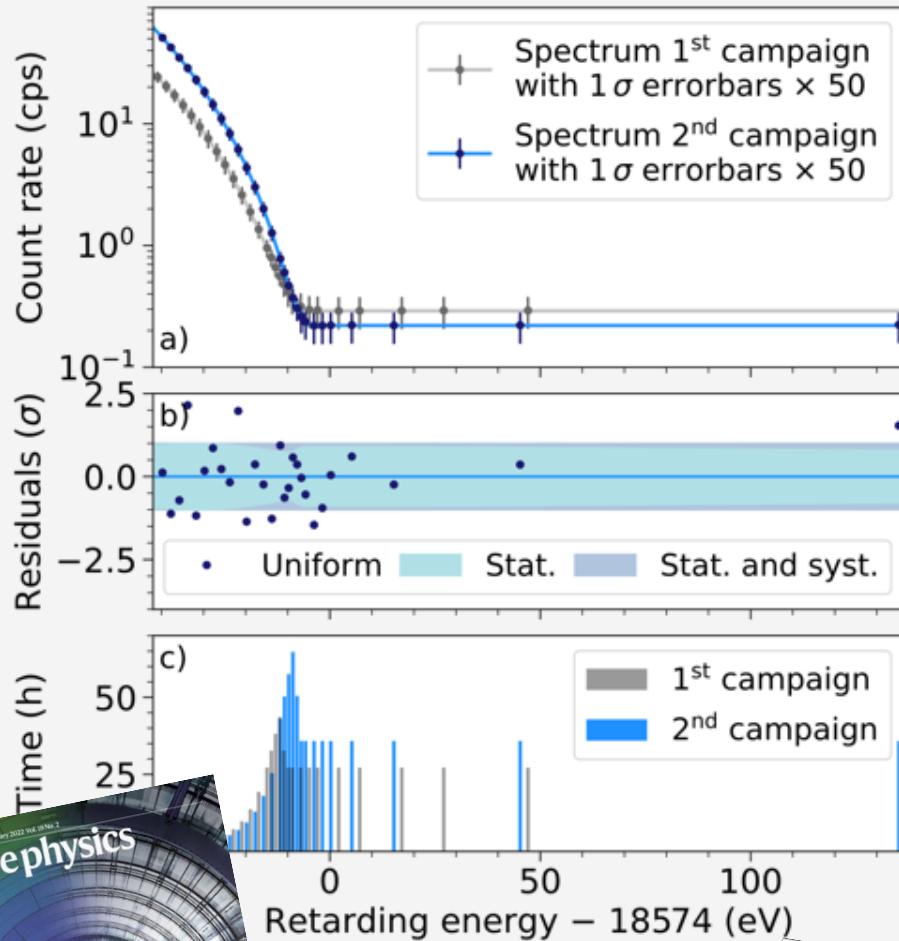

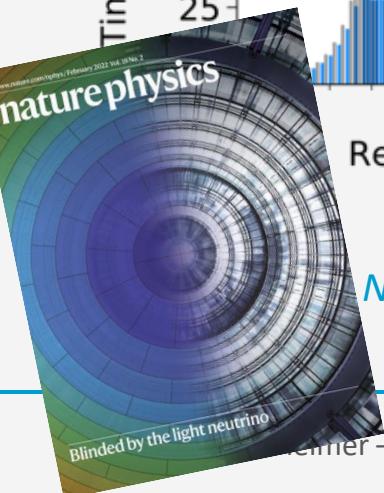

PRL 123 (2019) 221802

+ detailed analysis:

PRD 104 (2021) 012005

Recent KATRIN result of 2nd neutrino mass campaign

PRL 123 (2019) 221802
Nature Phys. 18 (2022) 160

$$m^2(\nu) = (0.26^{+0.34}_{-0.34}) \text{ eV}^2$$

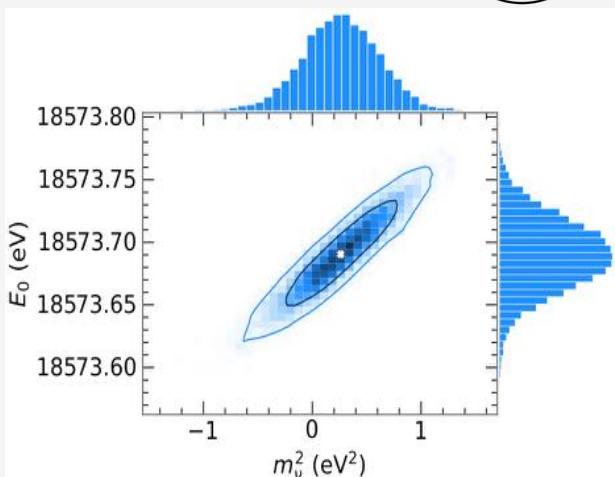

→ compatible with zero

$$E_0 = 18573.69 \pm 0.03 \text{ eV}$$

→ Q-value : $18575.2 \pm 0.5 \text{ eV}$

good agreement with Penning trap exp.:

$Q = 18575.72 \pm 0.07 \text{ eV}$, PRL 114 (2015) 013003

Frequentist limit: $m_\nu < 0.9 \text{ eV}$ (90% CL)

Same for Feldman & Cousins and Lokhov & Tkachov
less than sensitivity, due to positive fit result

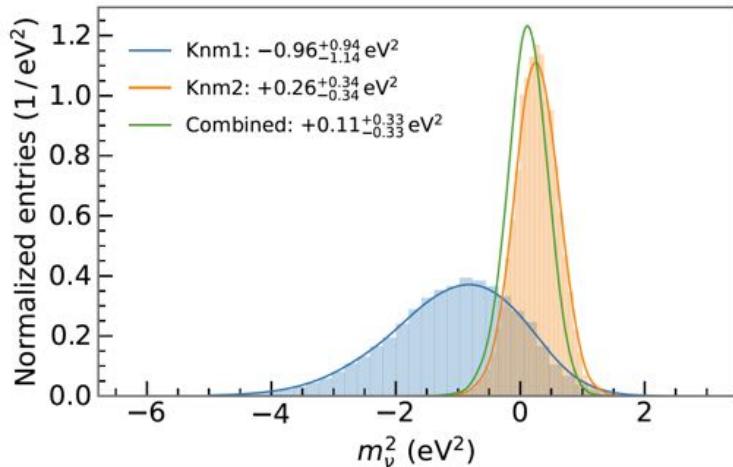

Bayesian: $m_\nu < 0.85 \text{ eV}$ (90% CI)

Lokhov & Tkachov, Phys. Part. Nucl. 46 (2015) 347
Feldman & Cousins, Phys. Rev. D57 (1998) 3873

Combine 1st & 2nd campaign:

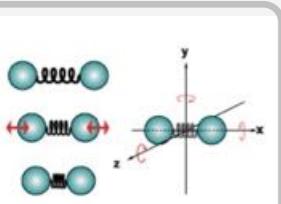

Frequentist: $m_\nu < 0.8 \text{ eV}$ (90% CL)

Bayes: $m_\nu < 0.7 \text{ eV}$ (90% CL)

Uncertainty breakdown: published run (KNM2)

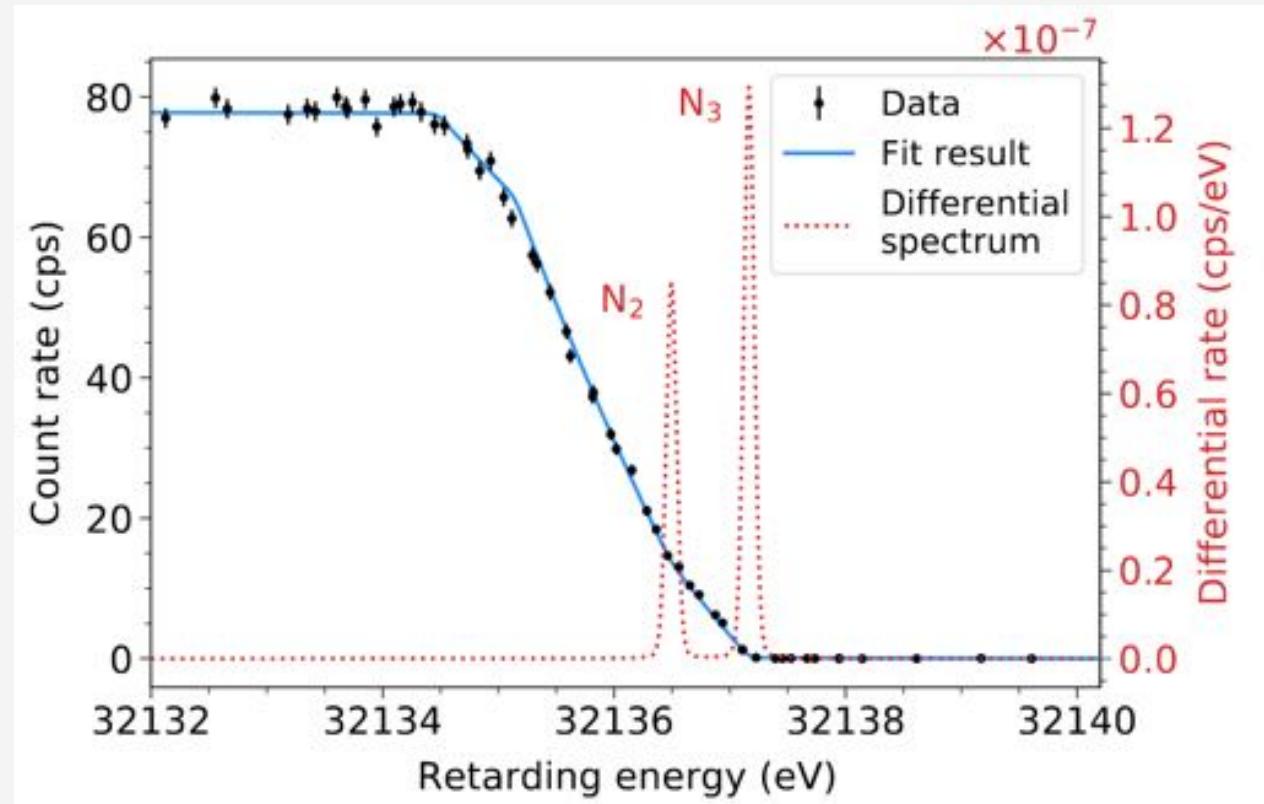

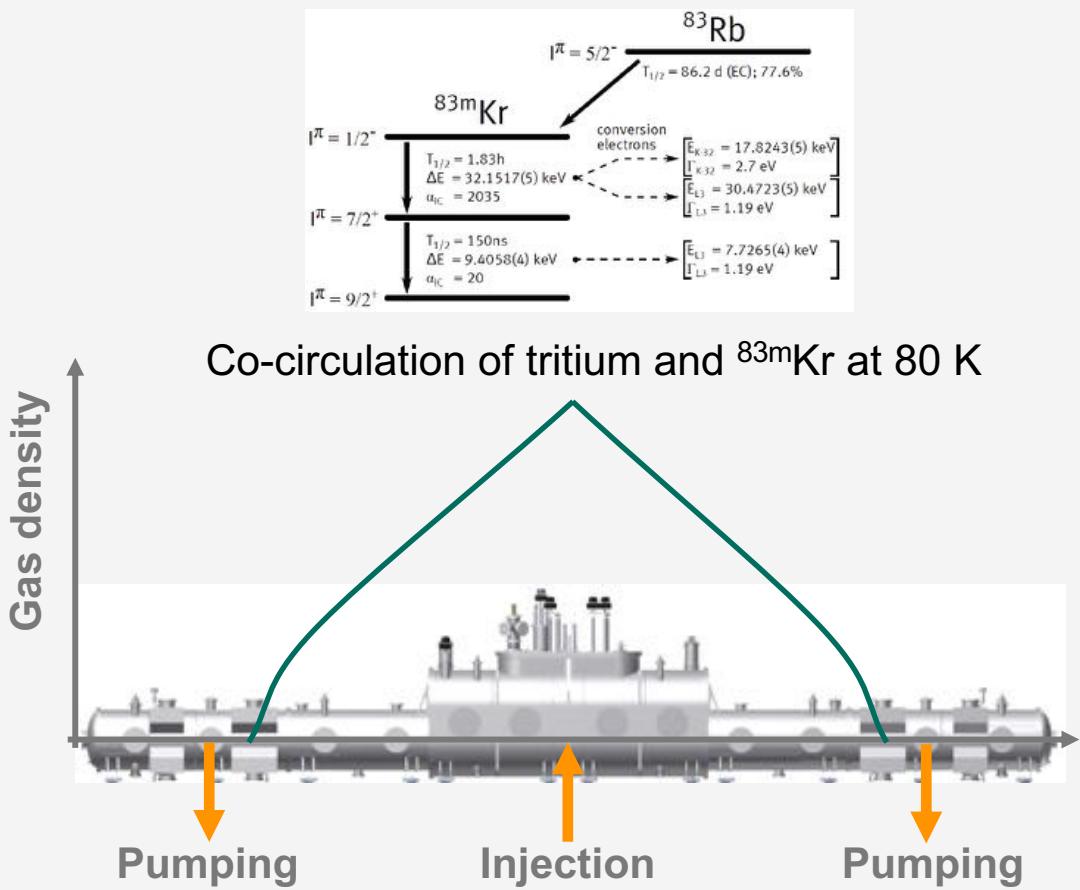

■ Budget for KNM2 (autumn 2019)

Budget is statistics dominated,
but various contributions by **background**
and **source systematics** are still too high

Nature Phys. 18 (2022) 160

Improving source-related systematics

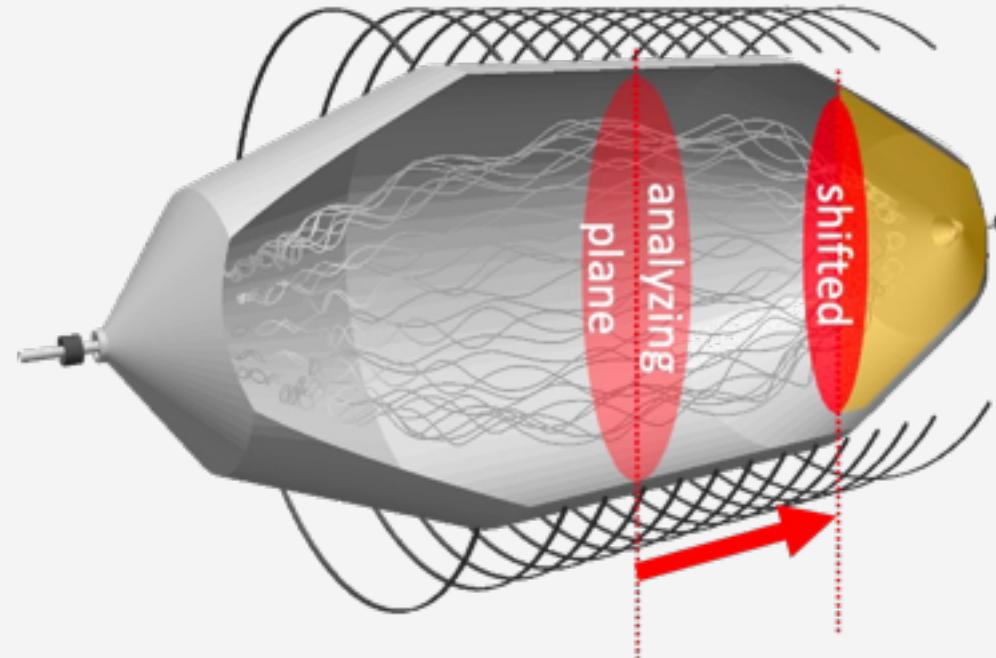

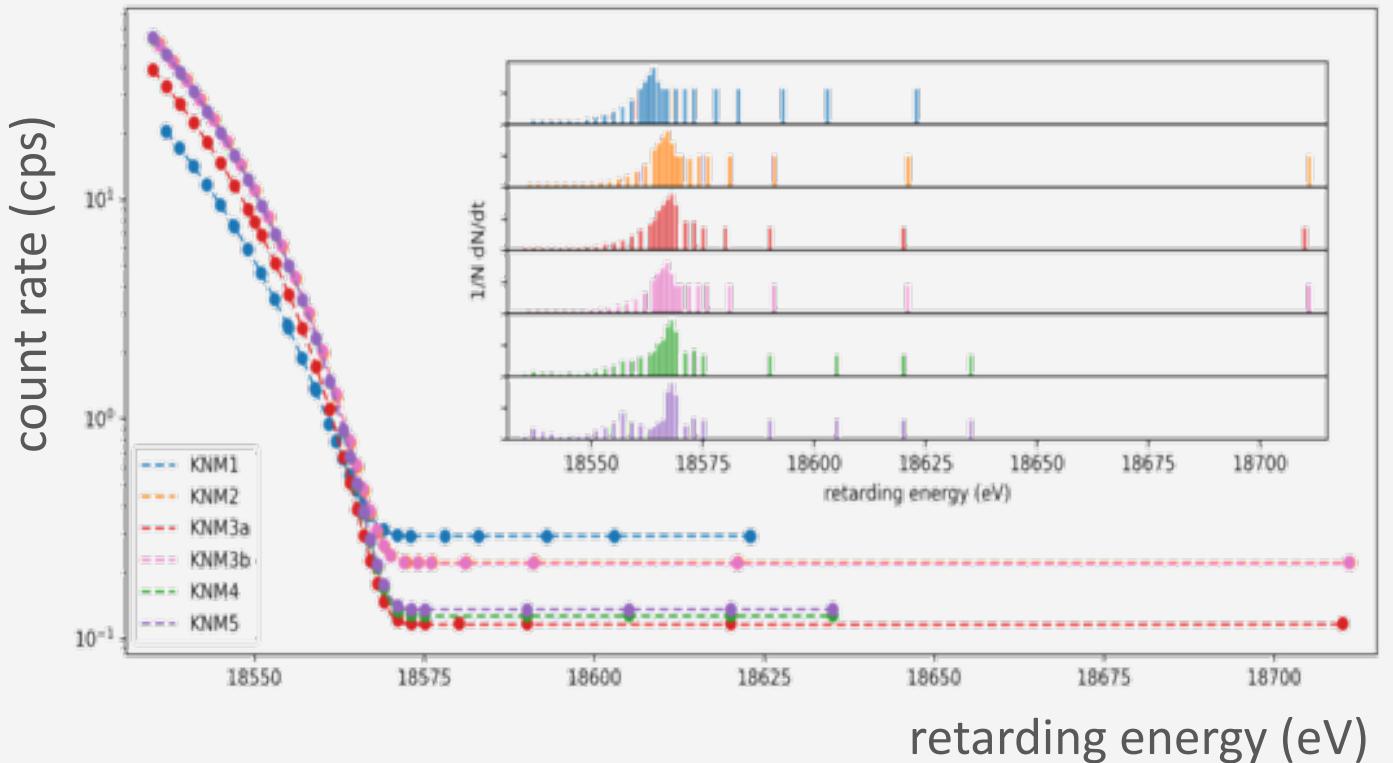

Data of 2020 krypton run at 40% tritium column density used to constrain systematics in 2nd campaign *Nature Phys.* 18 (2022) 160

Since then: New operation mode with stable co-circulation at high column density at 80 K

From summer 2021 on: **10 GBq Krypton generator (activity x6) → further reduction of plasma systematics**

KATRIN signal & background improvements

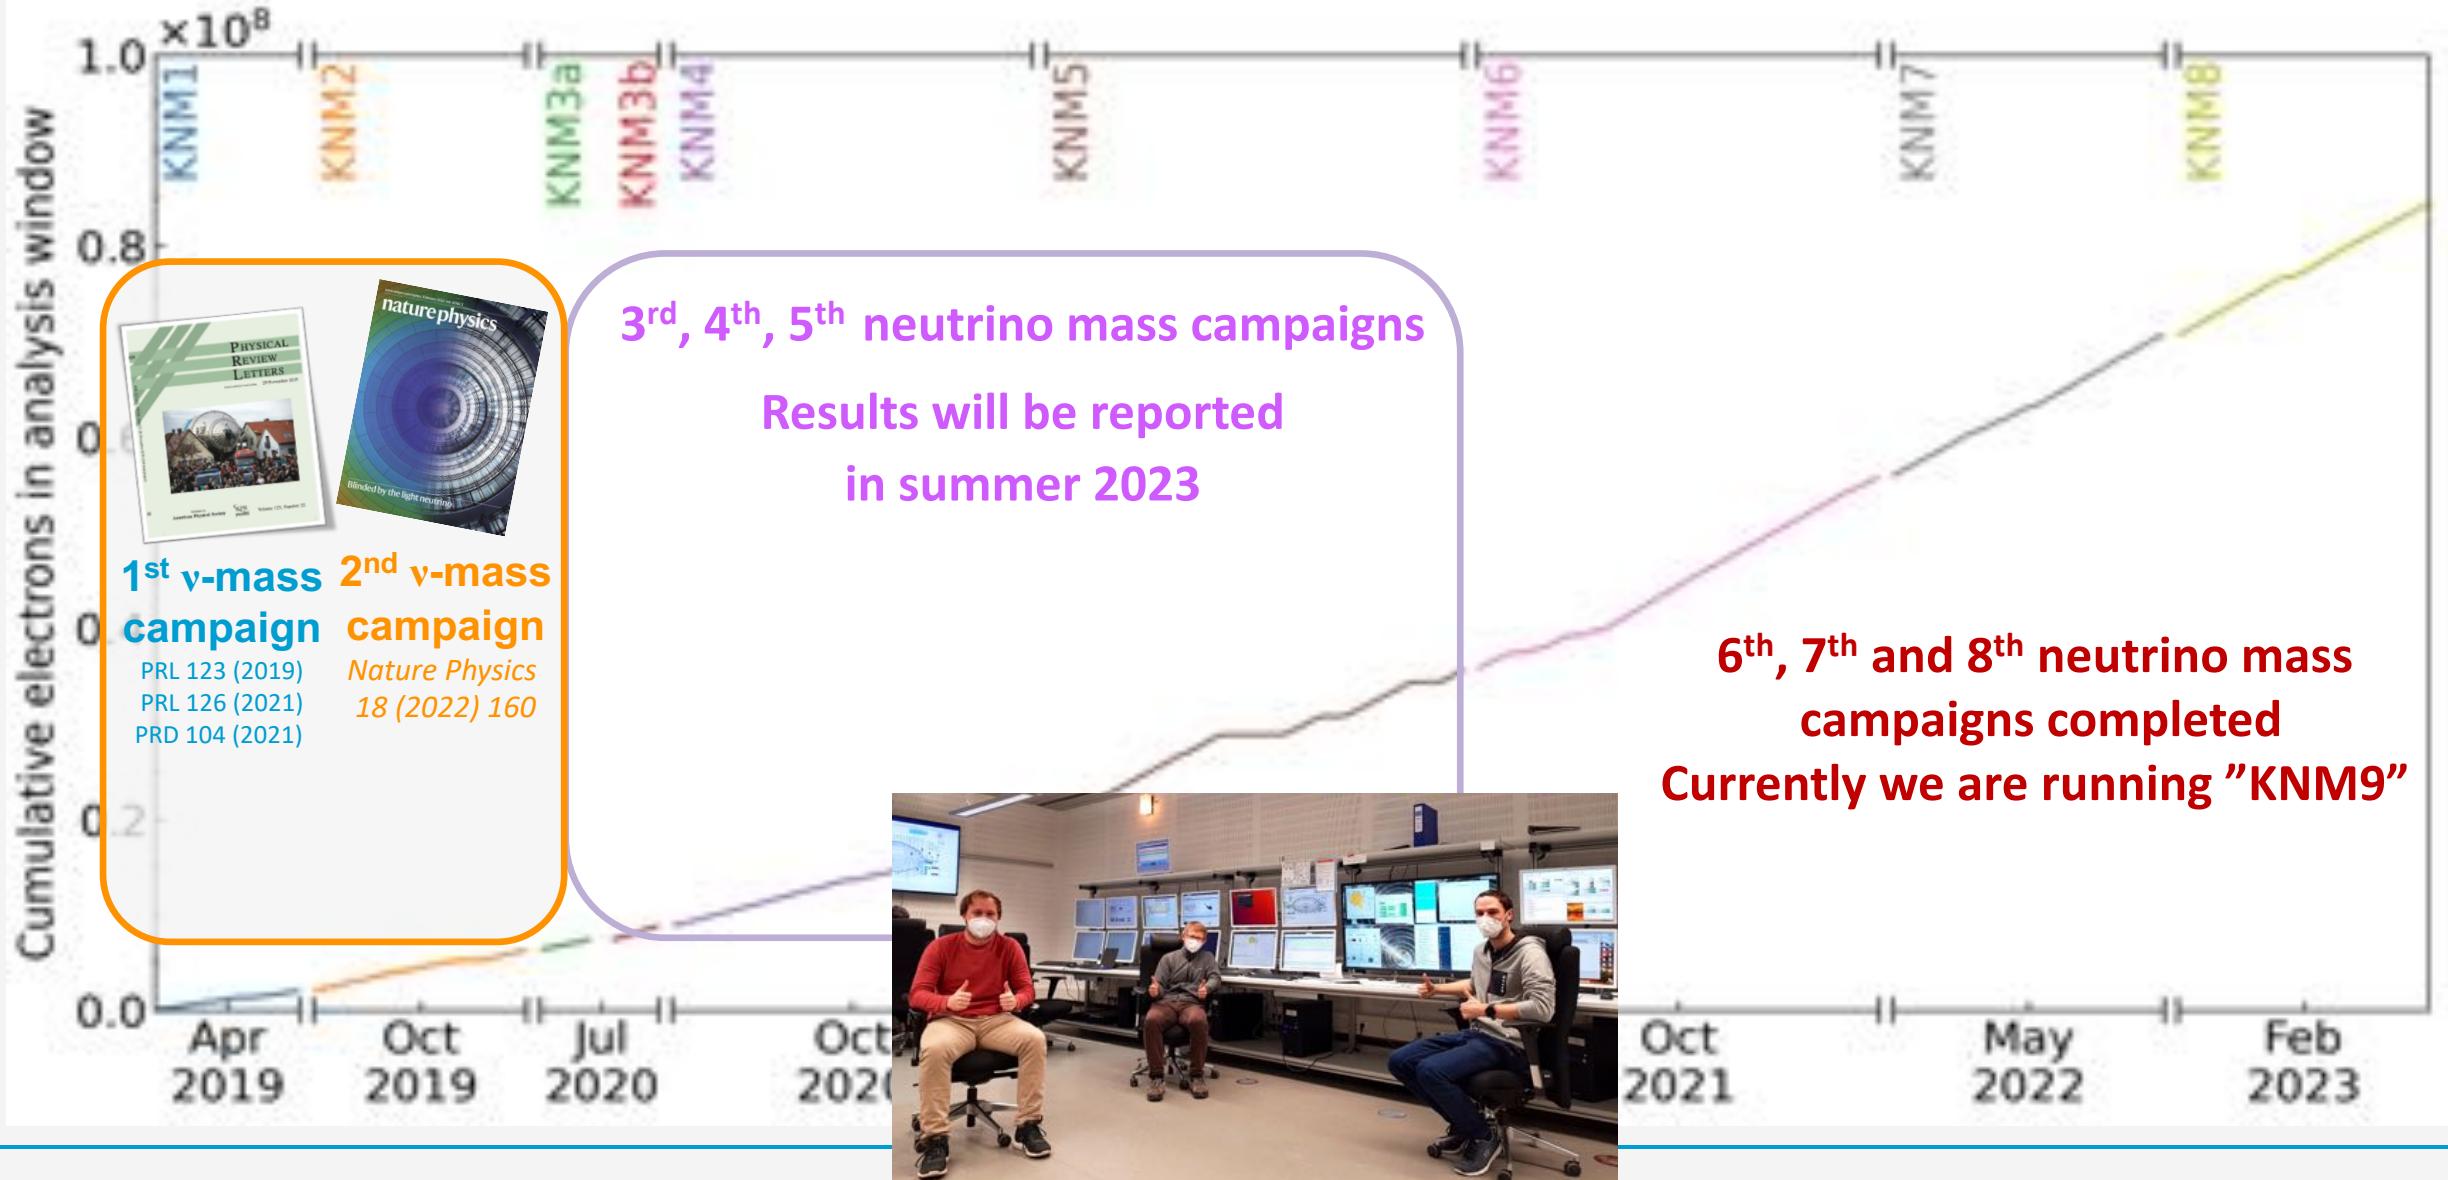

- continuous improvement of signal-to-background ratio

Shifting the analysis plane towards the detector reduced background by factor of 2

Eur. Phys. J. C 82 (2022) 258

KATRIN data taking continues

Uncertainty breakdown: later runs (here KNM5)

■ Budget for KNM5 (spring 2021)

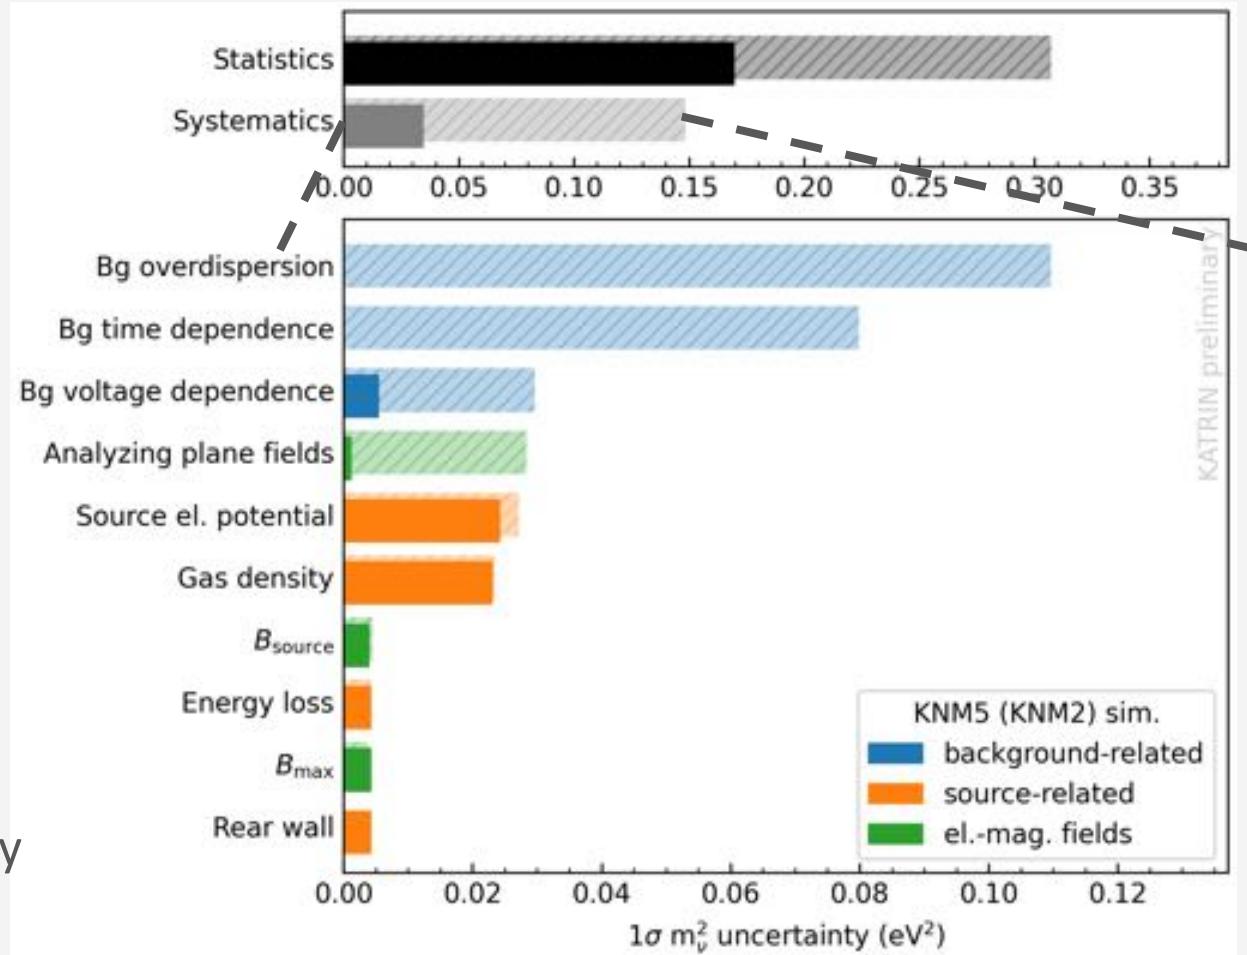

budget is statistics dominated, but

background-mitigation techniques:
avoid Penning trap,
shifted analyzing plane (SAP)

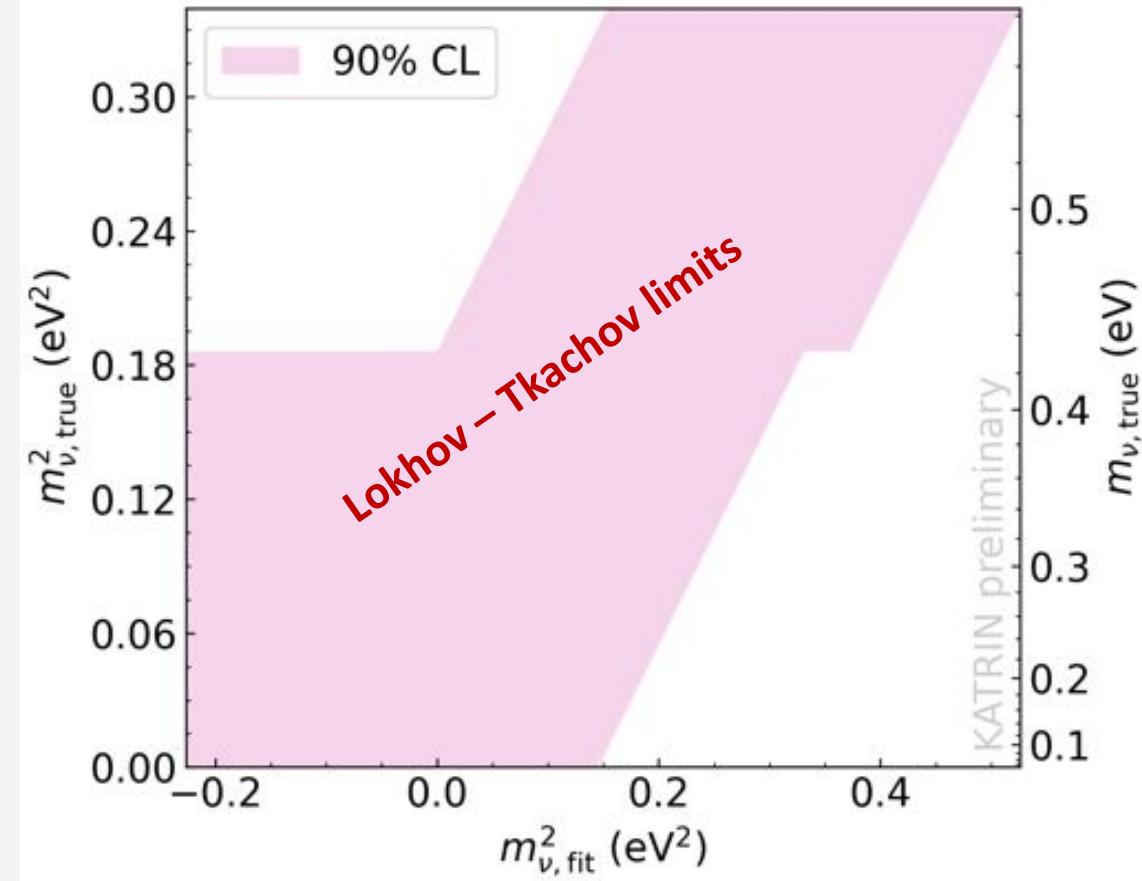

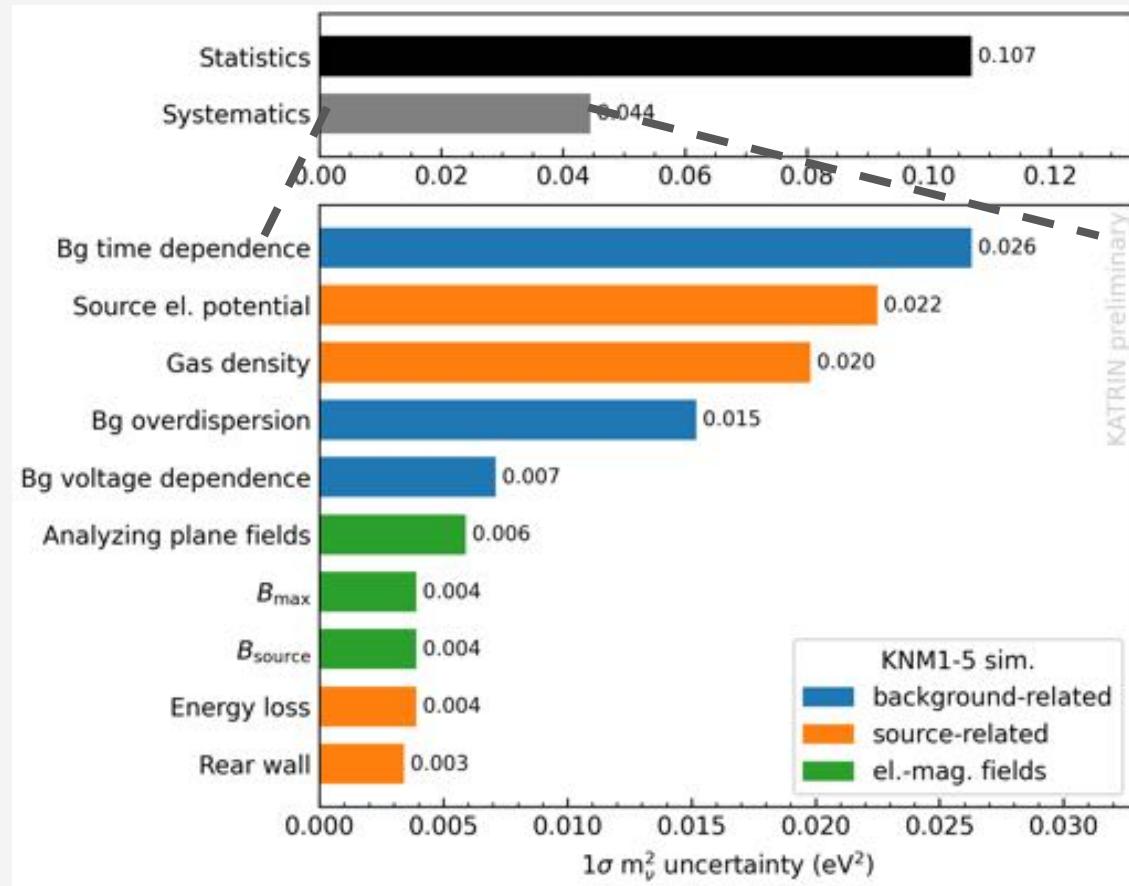

Lokhov et al., Eur.Phys.J. C 82 (2022) 258

high-statistics ^{83m}Kr campaign,
tritium scans at identical temperature / gas density

Altenmüller et al., J.Phys.G 47 (2020) 6, 065002

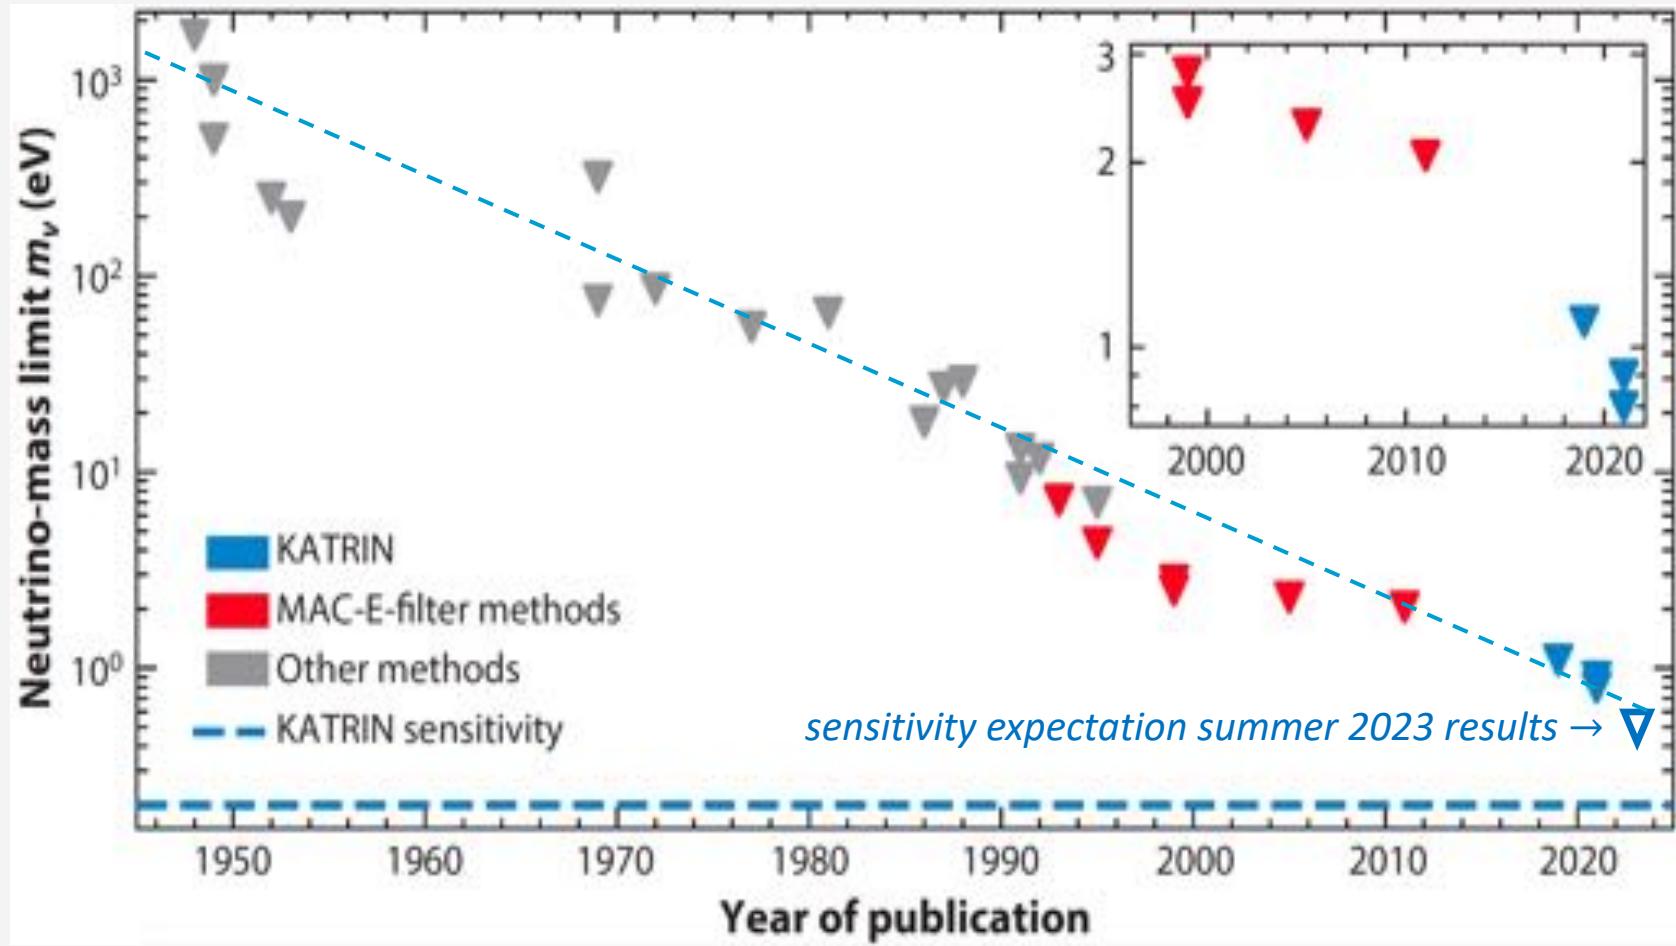

Sensitivity estimate of runs to be presented in summer 2023

→ expect sensitivity to neutrino mass scale $\approx 0.45 \text{ eV}$

KATRIN's sensitivity improvements on neutrino mass

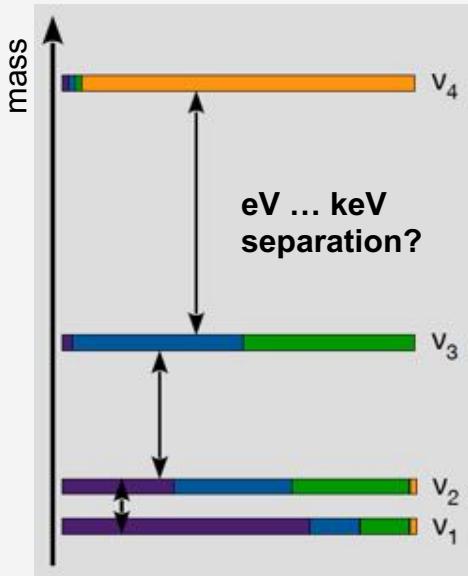

Annu. Rev. Nucl. Part. Sci. 72 (2022) 259

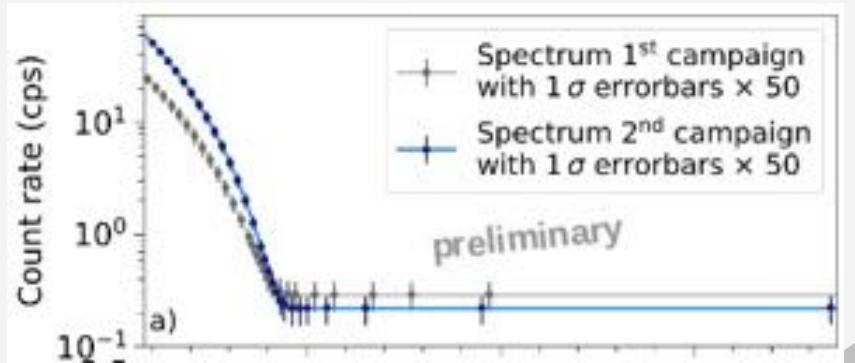

→ expect sensitivity to neutrino mass scale ≈ 0.45 eV

KATRIN „beyond the neutrino mass“

Is there a fourth
(sterile) neutrino?

Neutrino mixing: “Kink” in normal β -spectrum (eV scale) or deep β -spectrum (keV scale)

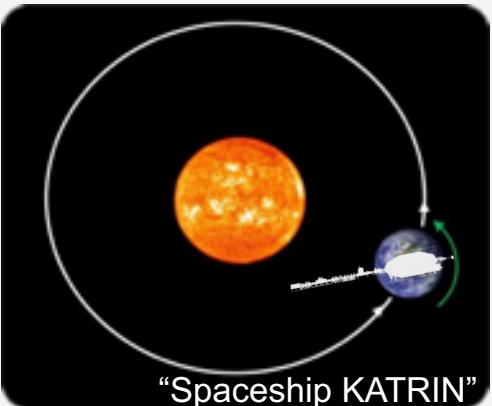

β -spectrum of high statistics and precision

Search for exotic weak interactions (spectrum shape)

Search for Lorentz invariance violation (sidereal modulation)

Constrain local overdensity of cosmic relic neutrinos (peak search)

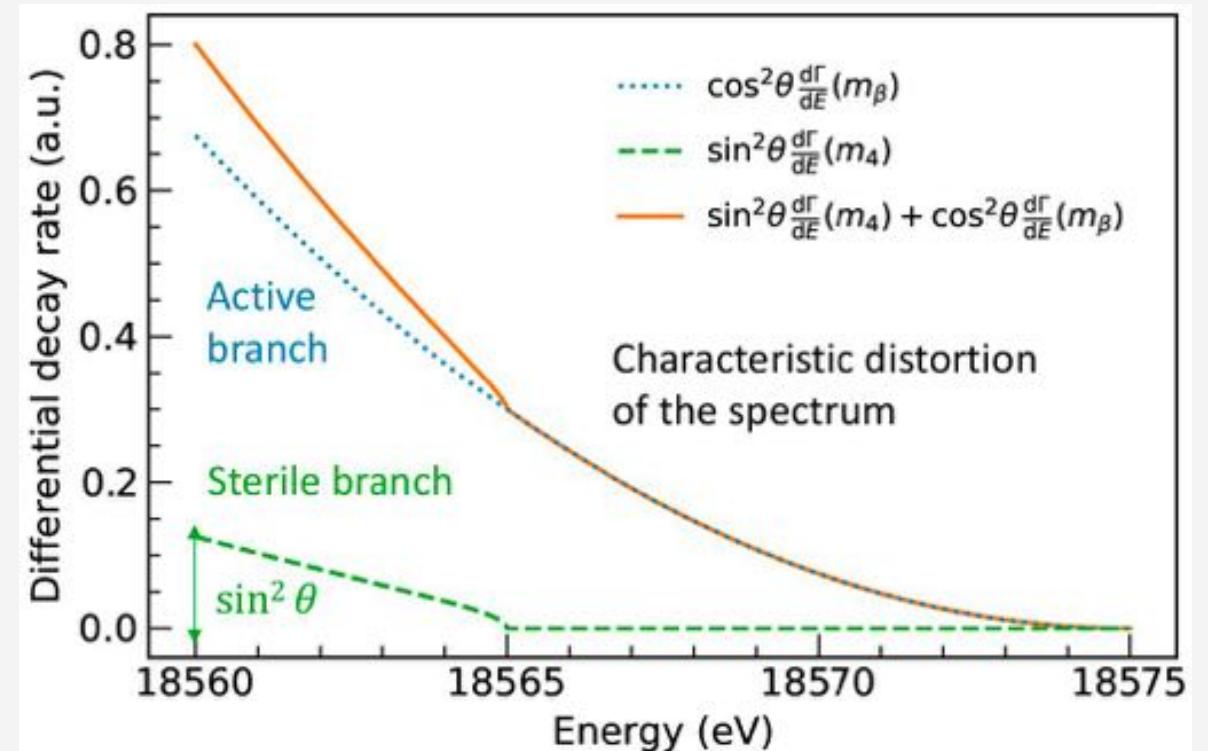

Constraints on light sterile neutrinos

Sterile neutrinos at eV-scale: a 4th state?

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \\ \nu_s \end{pmatrix} = U'_{PMNS} \cdot \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \\ \nu_4 \end{pmatrix}$$

The 4th neutrino mass state ν_4
would manifest in a kink in the beta spectrum

$$\frac{d\Gamma}{dE} = \underbrace{(1 - |U_{e4}|^2) \frac{d\Gamma}{dE}(m_\beta^2)}_{\text{light neutrino}} + \underbrace{|U_{e4}|^2 \frac{d\Gamma}{dE}(m_4^2)}_{\text{heavy neutrino}}$$

Constraints on light sterile neutrinos

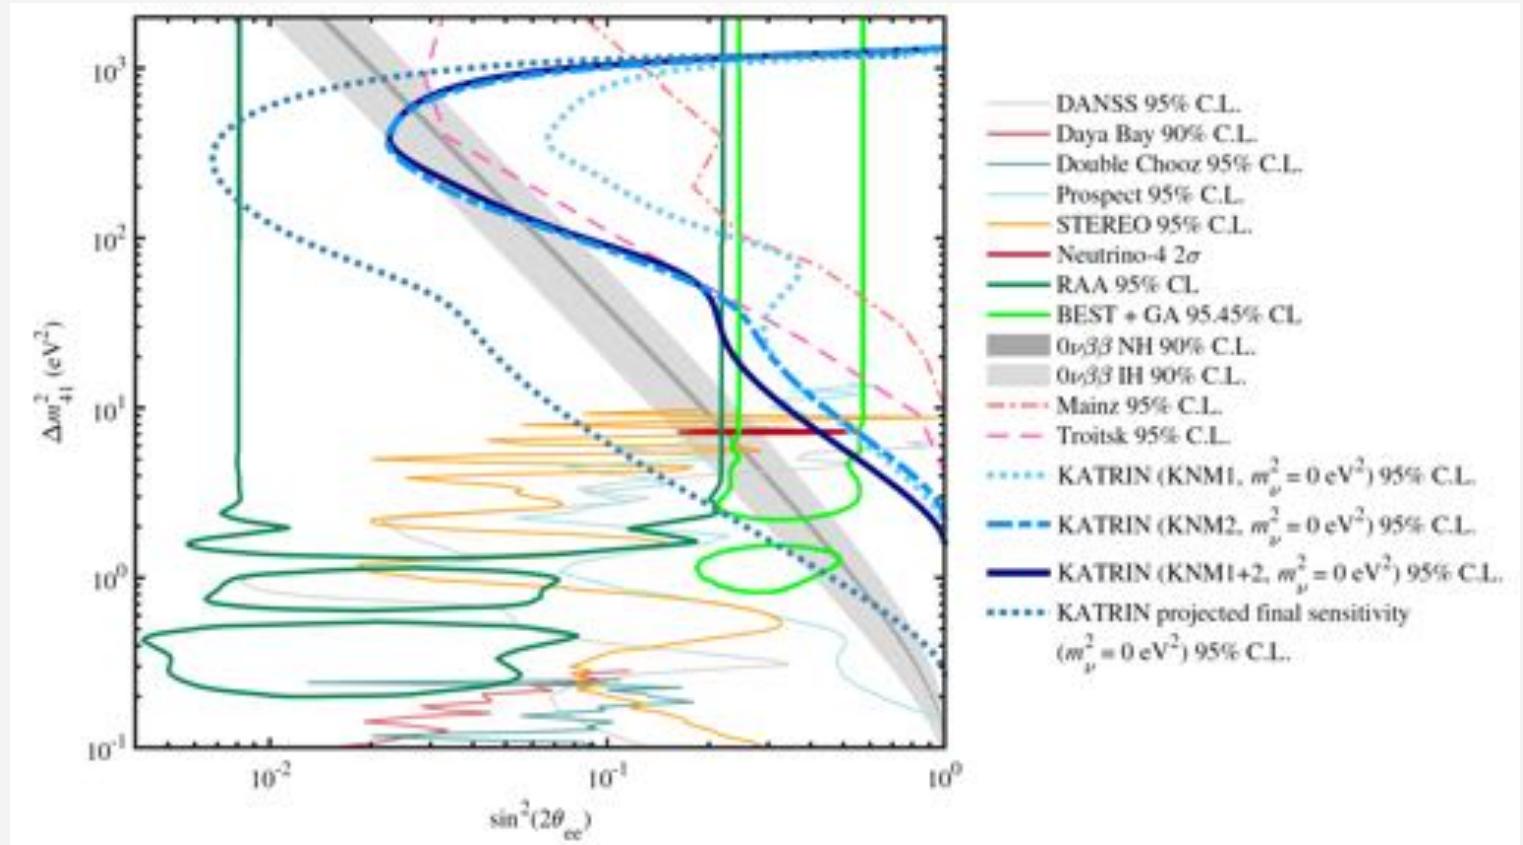

Sterile neutrinos at eV-scale: a 4th state?

$$\begin{pmatrix} \nu_e \\ \nu_\mu \\ \nu_\tau \\ \nu_s \end{pmatrix} = U'_{PMNS} \cdot \begin{pmatrix} \nu_1 \\ \nu_2 \\ \nu_3 \\ \nu_4 \end{pmatrix}$$

The motivation comes from anomalies in short baseline oscillation accelerator, solar and reactor neutrino experiments

KATRIN starts to probe very interesting parameter space, complementary to oscillation searches

Phys. Rev Lett. 126, 091803 (2021)
Phys. Rev. D 105 (2022) 7, 072004

Expected sensitivities on light sterile neutrinos

Results
by KATRIN

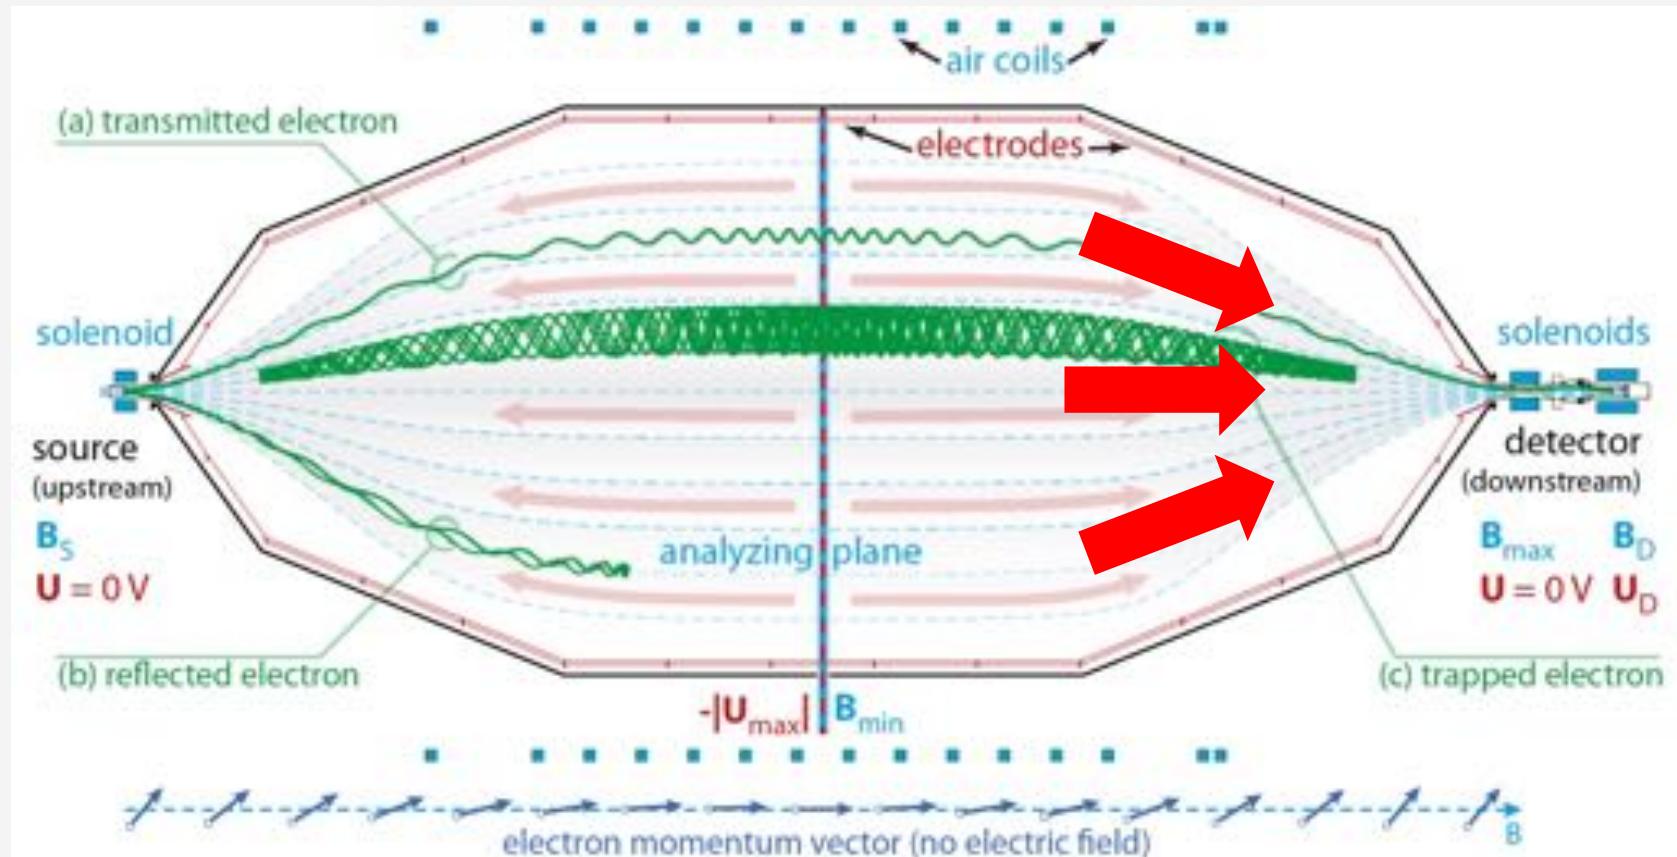

Further reduction of background rate

Main spectrometer of MAC-E-filter type

Magnetic gradient force: transforms transversal energy E_{\perp} into longitudinal energy $E_{||}$ ($\frac{E_{\perp}}{B} = \text{const. , non-rel.}$)

Electrostatic filter: retarding voltage U let electrons through above a certain energy $E \sim E_{||} \geq qU$

Sensitive to backgrounds:

- Low energy electrons “born” in the spectrometer volume will be accelerated to detector (same energy as signal electrons)
- Electrons can be trapped in the magnetic bottle of MAC-E-Filter or in local Penning traps → secondary electrons

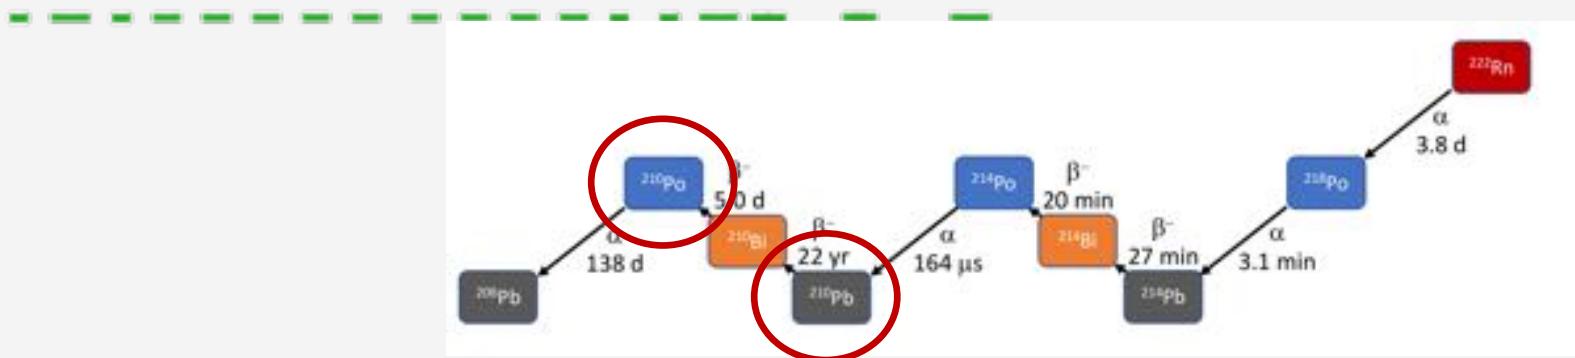

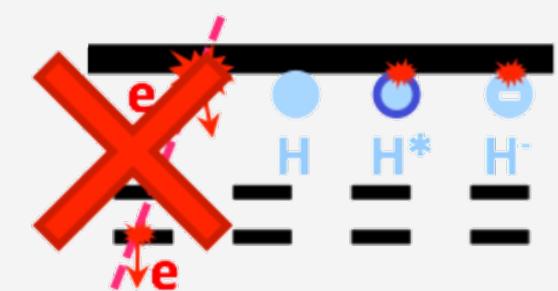

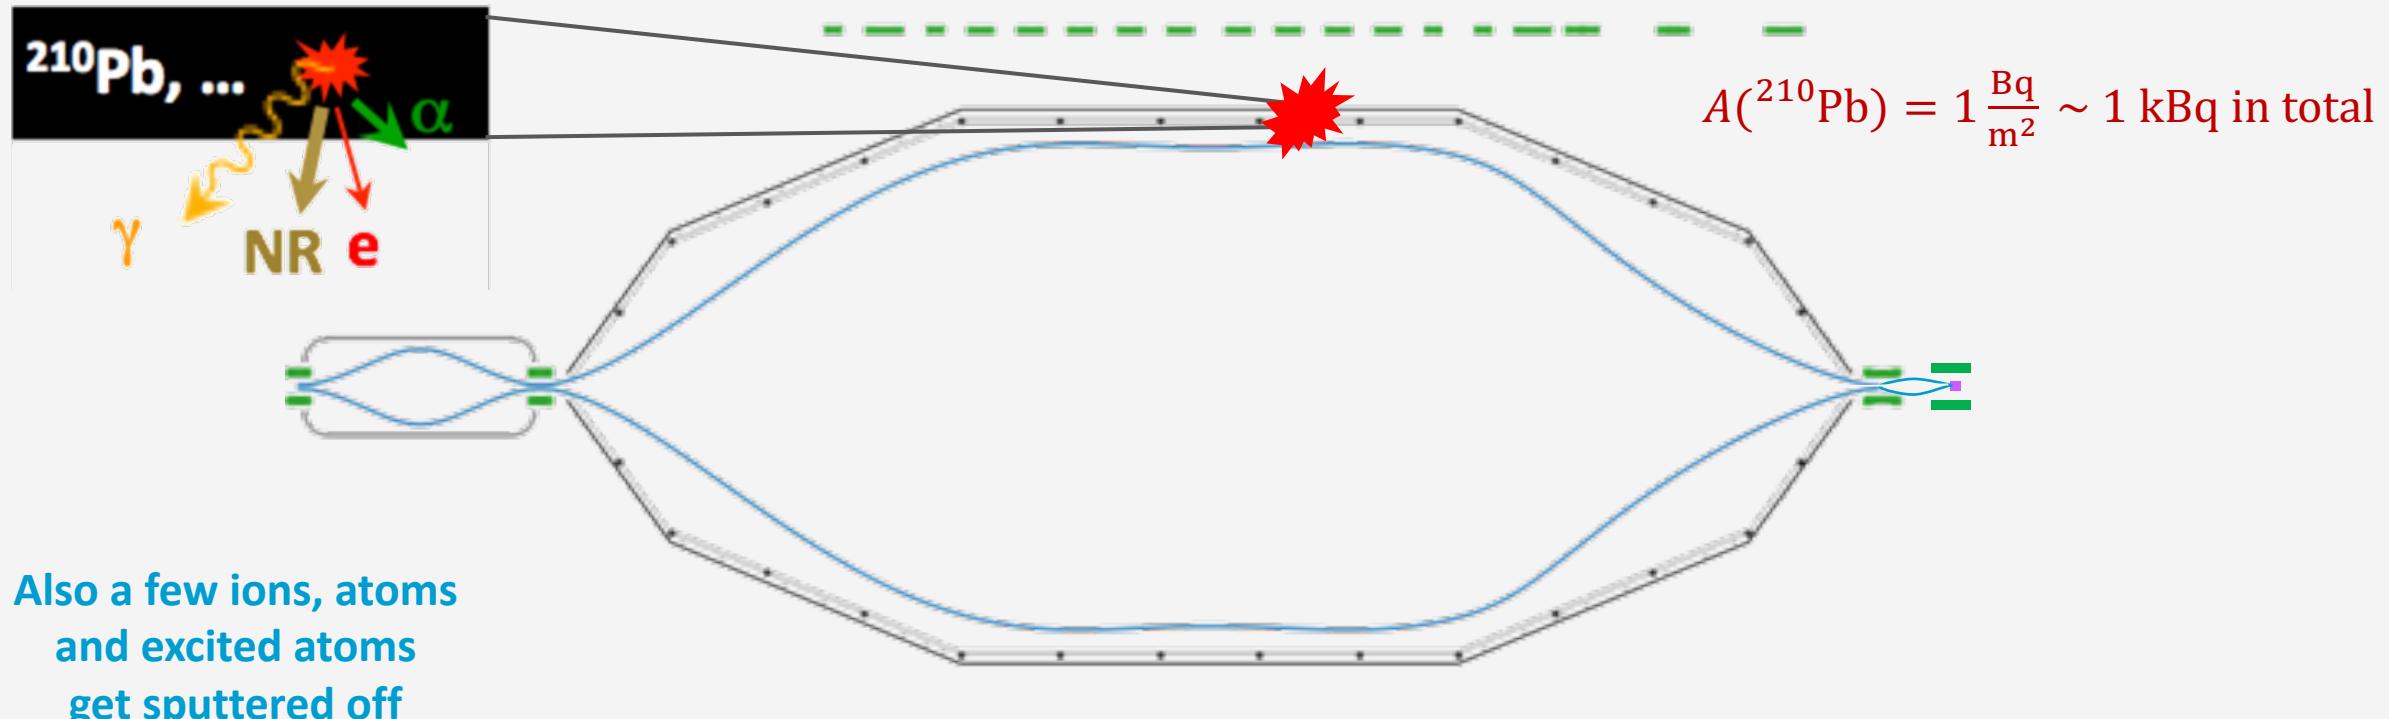

Very high energy resolution

$$\Delta E = \mathcal{O}(1\text{eV})$$

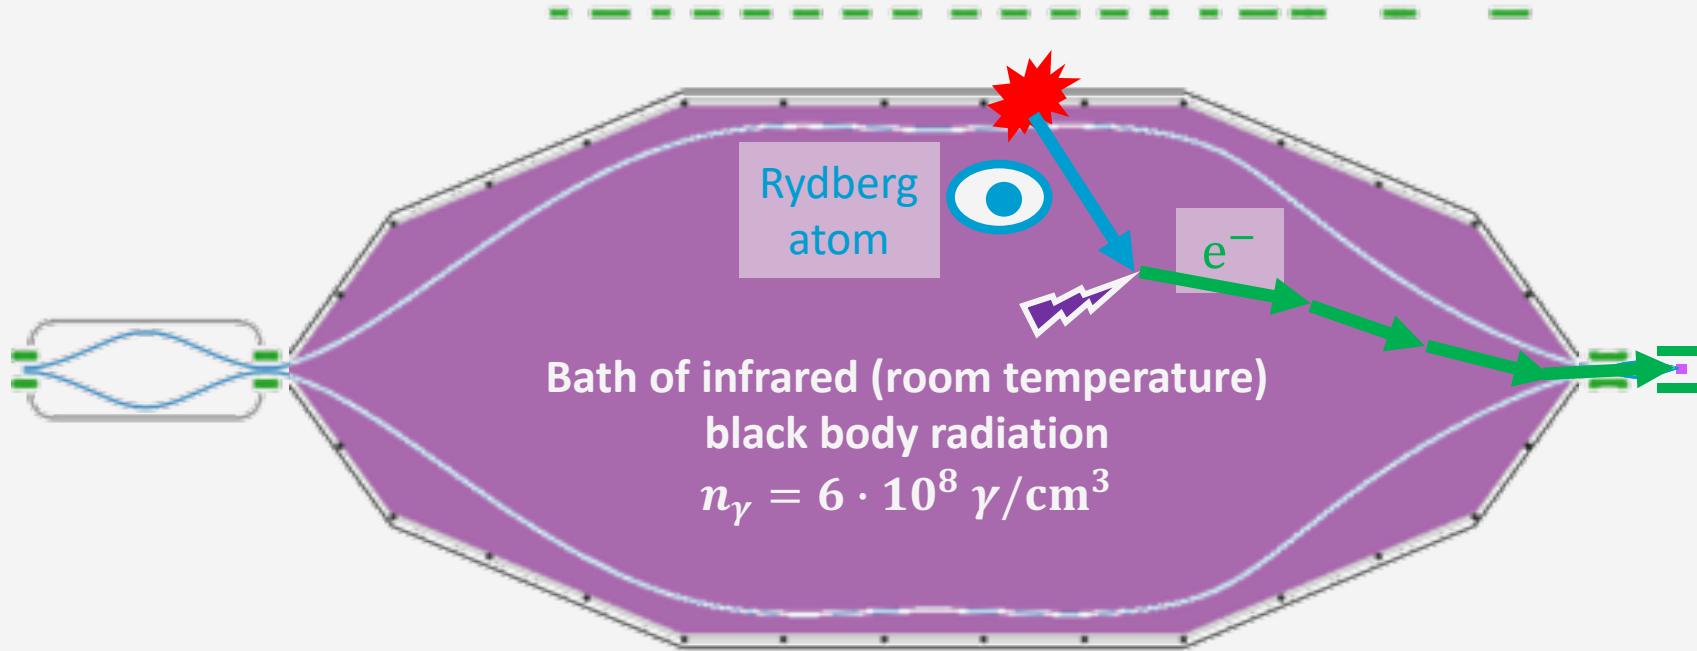

Very high angular acceptance:

$$\Delta\Omega \approx \pi$$

An unexpected background ^{210}Pb in wall \rightarrow ^{210}Po α decays from installing the spectrometer under ambient air (^{222}Rn)

^{210}Po α decays create “Rydberg” atoms \rightarrow background electrons

Rydberg background hypothesis:

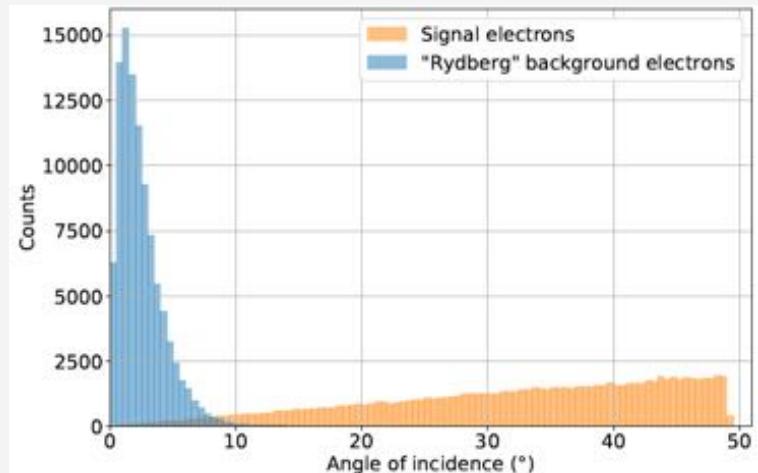

Neutral Rydberg atom overcomes electromagnetic barriers,
is ionized in the flux tube by infrared photons,
electron follows the electric potential gradient following the magnetic field lines to the detector.
Energetically practically indistinguishable from β electrons.

Astropart. Phys. 138 (2022) 102686

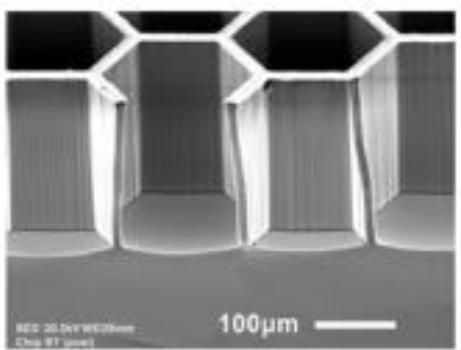

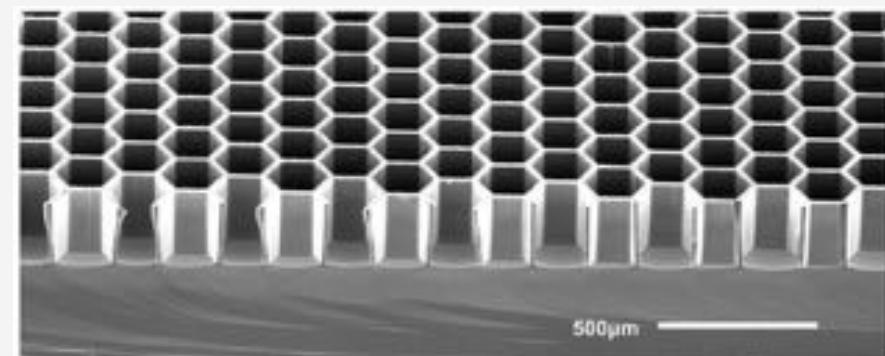

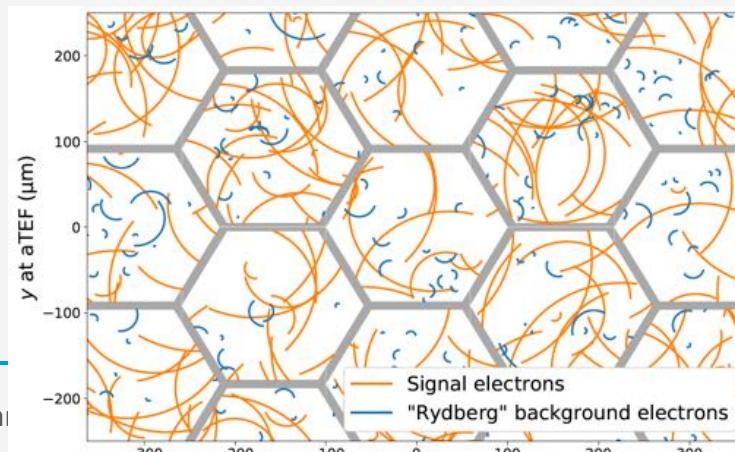

Different angular distributions → transverse energy filter

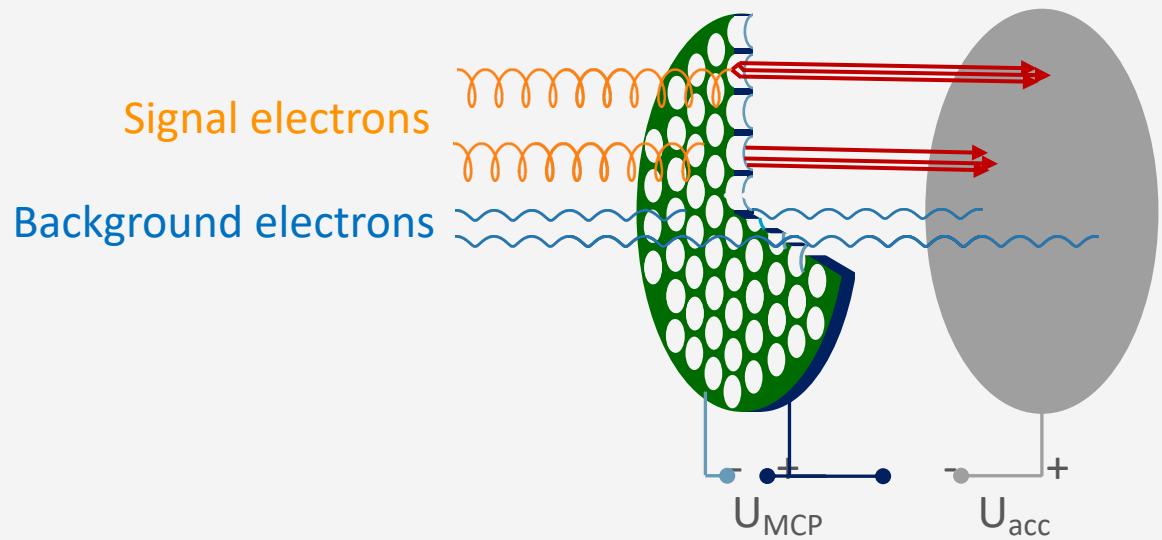

“Rydberg electrons” are released in spectrometer volume with very little starting energy $\mathcal{O}(k_B T)$, and accumulate practically only longitudinal energy $E_{||}$, but $E_{\perp} \approx k_B T$
 → sharp angular distribution at detector,
 in contrast to β electrons, which have E_{\perp} up to $\Delta E \sim 2.7$ eV

Eur. Phys. J. C 82 (2022) 922

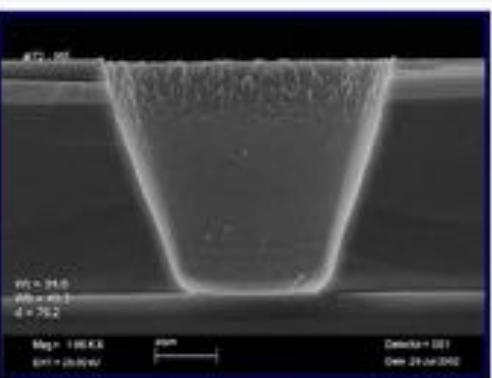

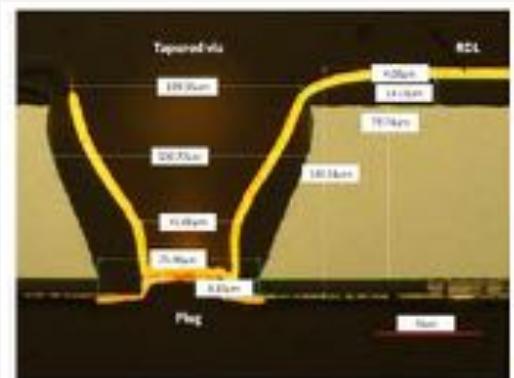

To suppress background need a detector which can distinguish large and small angles
 at very low energies (18.6 keV) and at strong magnetic fields (2.5 T at KATRIN detector)
 → make use of the different cyclotron radii (R.G.H. Robertson)
 → develop an “active transverse energy filter” (aTEF) by hexagonal shaped active detector surfaces (CW)

Principle demonstrated:
Eur. Phys. J. C 82 (2022) 922

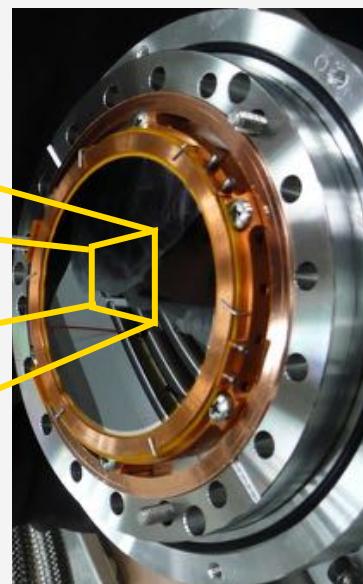

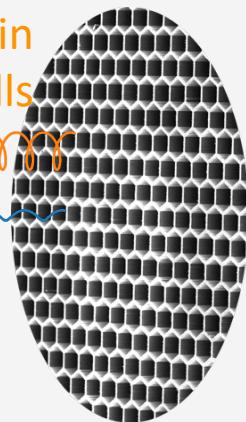

Etching of holes into
Si-semiconductor detectors
has been already successfully
demonstrated for other purposes
Rep. Prog. Phys. 81 (2018) 066101

Idea: micro-structure directly

TEF !

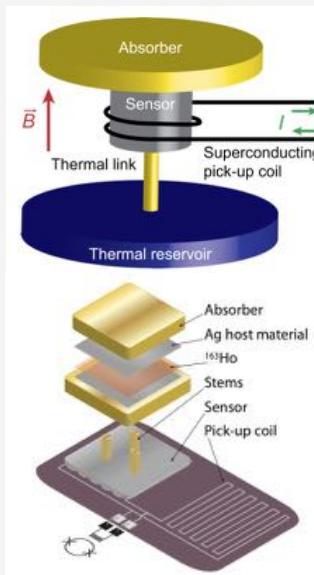

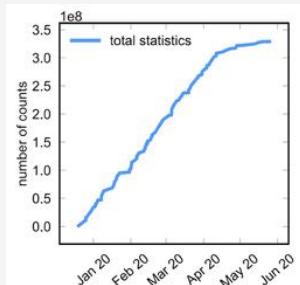

Direct $m(\nu_e)$ searches with cryogenic bolometers: ECHO, HOLMES

$$\Delta T \approx \frac{E}{C_{\text{tot}}} \xrightarrow{\text{MMC}} \Delta \Phi_S \propto \frac{\partial M}{\partial T} \Delta T \rightarrow \Delta \Phi_S \propto \frac{\partial M}{\partial T} \frac{E}{C_{\text{tot}}}$$

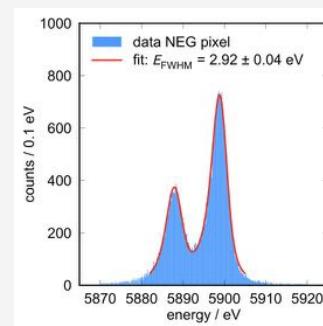

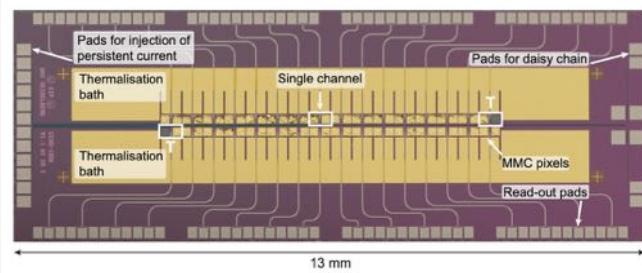

ECHO: metallic magnetic calorimeters (MMC):

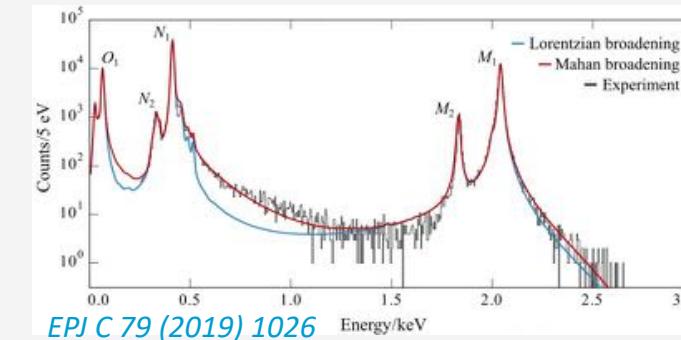

N. Kovac,
poster,
EPS HEP 2021

ECHO-1k phase:
 $m(\nu_e) < 20$ eV

ECHO-100k phase: 10 Bq per pixel
production of chips and wafers on-going
expected sensitivity: $m(\nu_e) \approx 2$ eV

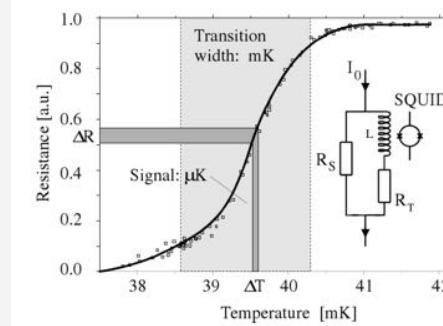

Understanding the em. deexcitation spectrum:

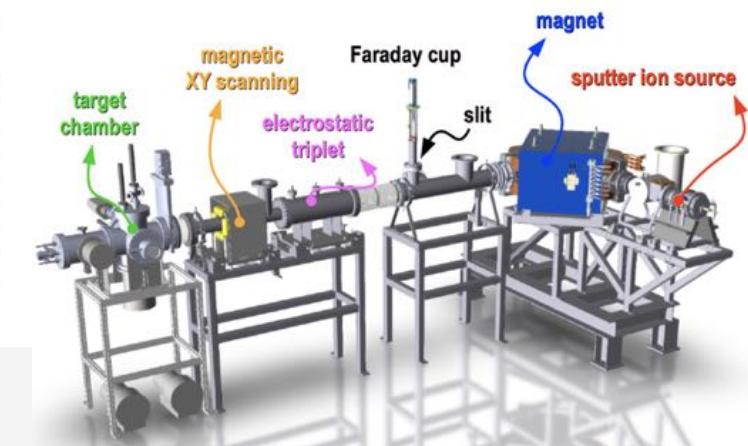

ECHO: $Q_{\text{EC}} = (2838 \pm 14)$ eV
Ship- trap: $Q_{\text{EC}} = (2833 \pm 30_{\text{stat}} \pm 15_{\text{syst}})$ eV

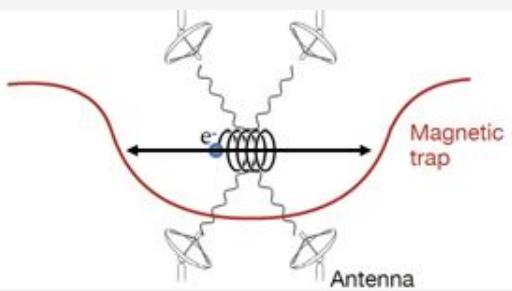

HOLMES: superconducting transition edge sensors (TES)

JLTP 193 (2018) 1137

Direct $m(v)$ beyond KATRIN: Project 8

$$\boxed{\omega} = \frac{\omega_0}{\gamma} = \frac{qB}{m_e + \boxed{E}}$$

Uses the principle of **Cyclotron Radiation Emission Spectroscopy (CRES)** to reconstruct total energy of electrons.

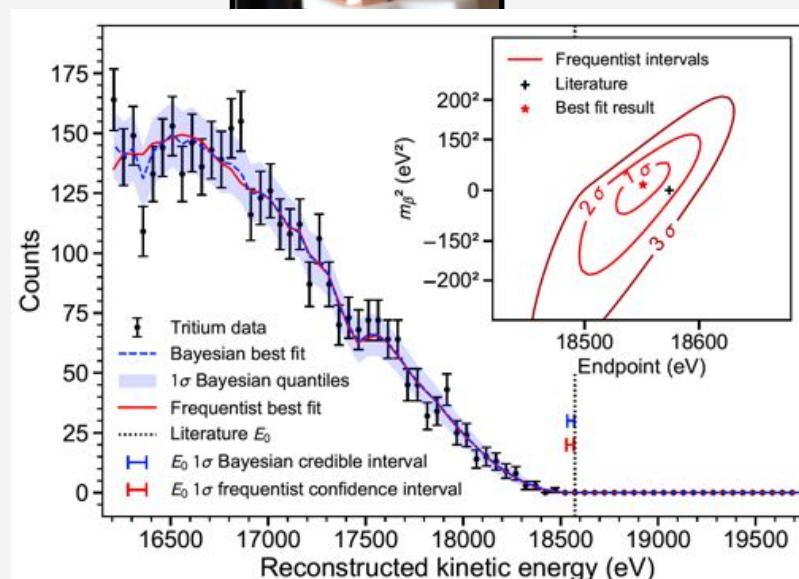

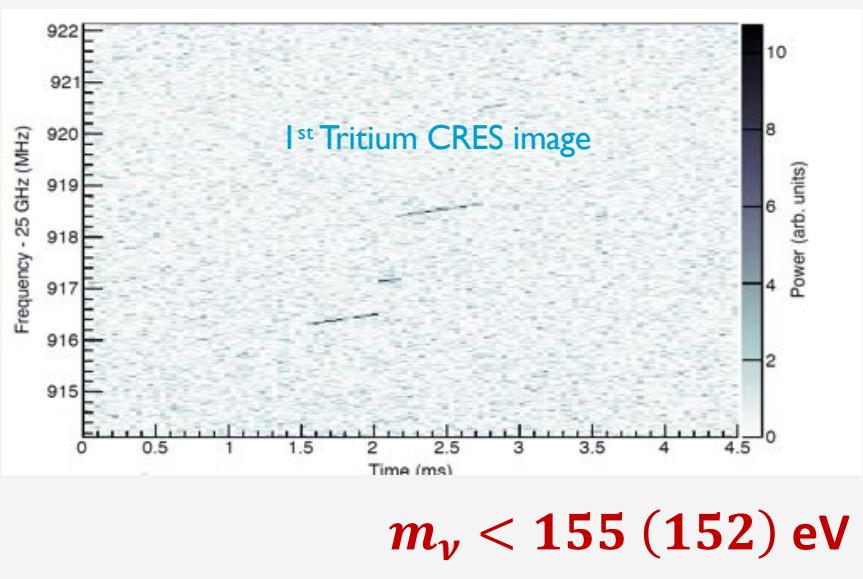

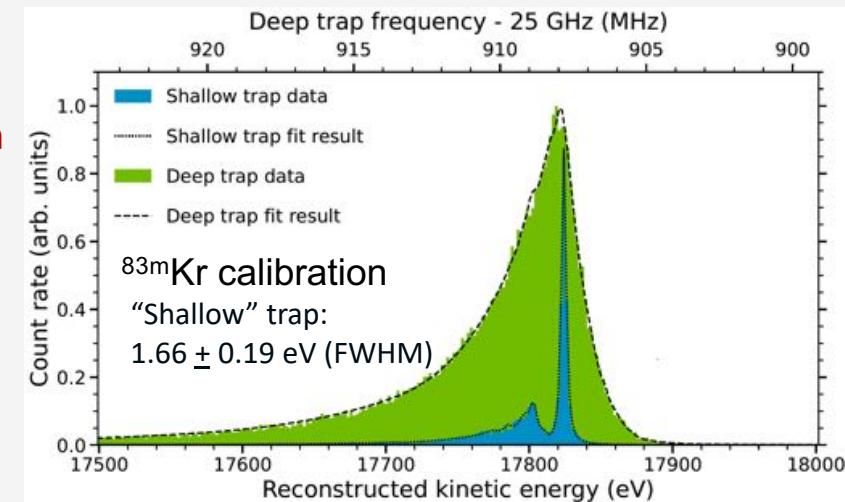

Phase I & II

First tritium run using CRES in 2019-2020

Low background achieved

[arXiv:2212.05048](https://arxiv.org/abs/2212.05048)

Phase III & IV

A future CRES experiment will require large volumes and an atomic tritium source.

Eventually, Project 8 wants to build an experiment with sensitivity O(40 meV).

Conclusions

- Direct neutrino mass search
 - very important for astrophysics & cosmology and for nuclear & particle physics (BSM physics)
 - complementary to cosmological analyses and $0\nu\beta\beta$ searches
- Direct neutrino mass experiment KATRIN
 - is taking data with unprecedented precision since 2019
 - is continuously improving statistical and systematic uncertainties
 - has presented **1st sub-eV limit: “ $m(\nu_e) < 0.8 \text{ eV}$ and will report on data soon with < 0.5 eV sensitivity”**
- KATRIN measures β -spectrum with unprecedented statistics and precision
 - beyond the Standard Model physics searches: eV and keV sterile neutrinos, CMB neutrinos, ...
- KATRIN’s background is dominated by “Rydberg electrons” (and from auto-ionizing states)
 - > efforts to lower background further towards sensitivity goal of 0.2 eV: aTEF, ...
- New direct neutrino mass projects have started: ECHo, HOLMES, Project 8, ...
- KATRIN will go on: TRISTAN detector for dedicated keV sterile neutrino search, starting to think of KATRIN⁺⁺
