#### Outline

- Motivation
- PANDA Experiment at FAIR
- Towards Realistic Hyperon Reconstruction:
  - Muon Reconstruction
  - ▶ Hyperon Reconstruction
- Track Evaluation
- Conclusions and Outlook

э

#### Motivation

How well can machine learning be used for the purpose of track reconstruction? Most importantly, reconstructing

- Low momentum tracks, and
- with displaced vertices

These questions are answered in Part II of my doctoral thesis [1].

[1] A. Akram, Towards Realistic Hyperon Reconstruction in PANDA: From Tracking with Machine Learning to Interactions with Residual Gas, Doctoral Thesis, Uppsala University, Uppsala (2023)

イロト イヨト イヨト

June 13, 2023

#### PANDA Experiment at FAIR

- PANDA is general-purpose fixed target experiment with almost  $4\pi$  coverage.
- Antiproton beam: 1.5 GeV/c to 15 GeV/c from High Energy Storage Ring (HESR).
- The interaction rate up to 20 MHz.

June 13, 2023

#### The PANDA Detector

### Straw Tube Tracker (STT)

- 4224 straw tubes
- 15 19 axial layers (green)
- 8 skewed layers  $(\pm 2.9^{\circ})$  (red and blue)
- $\bullet\,$  Radial coverage: 15 cm to 41.8 cm

イロト イボト イヨト イヨト

### What is the challenge?

Focus on the  $r\phi\mbox{-plane}$  of the STT detector:

- Detector geometry:
  - straight and skewed tubes
  - hexagonal arrangement of straw tubes
- Track topology:
  - spiraling
  - overlapping
  - ► crossing
- $\Rightarrow$  Use deep learning for track reconstruction

The strategy is to use two pipelines:

- Deep Learning (DL) pipeline
  - A standard approach, tested on **muons**  $(\mu^{\pm})$
- Geometric Deep Learning (GDL) pipeline
  - A more elaborate approach was first tested with **muons**  $(\mu^{\pm})$  and then with **hyperons**

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・ ・ つ へ つ

8/34

June 13, 2023

 $\Rightarrow$  Track evaluation

### The Pipeline

 $\Rightarrow$  Pipelines only differ in *Edge Construction* and *Edge Classification* stages.

	June 13, 2023	9/34

Adeel Akram (PANDA C.)

Let's define the variables first:

- $N_{\text{particles}}$ : # of generated particles in the detector
- $N_{\text{tracks}}$ : # of reconstructed tracks containing at least 5 or 6 hits (denoted  $N_r$ )
- $\bullet\,$  Selected: # of particles/tracks within STT acceptance.
- Reconstructable: # of particles with # of hits > 7 STT hits (denoted  $N_t$ ).
- Matched: # of particles (tracks) matched to a reconstructed track (particle).

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・ ・ つ へ つ

## Track Evaluation (II)

A particle is **matched** to a reconstructed track if more than

- 50% of the hits in the reconstructed track belong to the same true particle, and
- 50% of the hits in the matched true particle are found in the reconstructed tracks.

This is known as a two-way matching scheme with a matching fraction (MF) > 50%.

11/34

イロト イボト イヨト イヨト

#### Track Evaluation (III)

 $\epsilon_{\rm phys}$  is the efficiency considering both detector and algorithm:

$$\epsilon_{\rm phys} = \frac{N_{particles} ({\rm selected, matched})}{N_{particles} ({\rm selected})}$$

 $\epsilon_{\rm tech.}$  is the efficiency of algorithm itself:

$$\epsilon_{\text{tech.}} = \frac{N_{particles} (\text{selected, reconstructable, matched})}{N_{particles} (\text{selected, reconstructable})}$$

Track purity measures the accuracy of a reconstructed track in matching a particle:

$$Purity = \frac{N_{tracks}(selected, matched)}{N_{tracks}(selected)} \equiv 1 - Ghost Rate$$
(3)

Adeel Akram (PANDA C.)

June 13, 2023 12 / 34

(1)

(2)

#### Track Evaluation (IV)

The transverse momentum  $(p_t)$ , lab polar angle of the track  $(\theta)$ , and azimuthal angle of the track  $(\phi)$  are defined as follows:

$$p_t = \sqrt{p_x^2 + p_y^2}$$
  

$$\theta = \tan^{-1}(p_t, p_z)$$
  

$$\phi = \tan^{-1}(p_y, p_x)$$

and the radial distance  $(d_0)$  between the interaction point and the decay vertex:

$$d_0 = \sqrt{v_x^2 + v_y^2}$$

- Five  $\mu^+\mu^-$  pairs per event using a *Box Generator*
- $100 \mathrm{MeV/c} 1.5 \mathrm{GeV/c}$
- In total,  $10^5$  events are generated
- Track reconstruction in  $r\phi$ -plane of STT, restricted to straight sections

#### Pipeline: Graph Construction

Graph representation of tracks (*i.e.* a hit graph) in terms of nodes and edges:

- *node*: hit position of a particle
- *edge*: a connection between two hits

A heuristic method for layer-wise edge construction in adjacent sectors:

- *input graphs*: contain True & False edges
- ground truth: contain only True edges

イロト 不得下 イヨト イヨト

Train a neural network on hit graphs to predict edges. There were two main differences:

- Deep Learning: directed graphs, classification with a dense network
- Geometric Deep Learning: bi-directed graphs, classification with interaction network

#### The Pipeline

- Same GDL pipeline as for muons
- $10^5 \ \bar{p}p \rightarrow \bar{\Lambda}\Lambda \rightarrow \bar{p}\pi^+p\pi^-$  events simulated at  $p_{beam} = 1.642 \text{ GeV/c}$
- 3 tracks per event on average  $\rightarrow \bar{p}$  emitted at small angles, escapes STT
- Final state particles are
  - ▶ low  $p_t$  hadrons such as  $p, \bar{p}$  and  $\pi^{\pm}$
  - ▶ with secondary decay vertices

The same evaluation criteria used for muons are used for hyperons. The results are

$N_t$	$N_r$	MF $[\%]$	$\epsilon_{phys.}$ [%]	$\epsilon_{tech.}$ [%]	GR [%]	CR [%]	
7	5	> 50	$89.6\pm0.5$	$97.1\pm0.6$	$0.5\pm0.6$	$4.9\pm0.1$	

Table: Tracking efficiencies, ghost rate (GR), clone rate (CR).

#### Conclusions

- Interaction Network (GDL) is proven to be better than the Dense Network (DL).
- Pion track efficiency > 95% for  $p_t > 0.05 \text{ GeV/c}$
- Proton track efficiency > 95% for  $p_t > 0.1 \text{ GeV/c}$ .
- Track efficiency > 90% in the full vertex position range considered *i.e.* up to  $d_0 = 14$  cm.

Heavier hyperons,  $\Xi^-$  and  $\Omega^-$ , decay into  $\Lambda$  hyperons with  $d_0 < 15$  cm [1].

27/34

June 13, 2023

The loss in efficiencies can be improved by using:

• A new method for building Ground Truth, especially for events with spiraling tracks

イロト イヨト イヨト ヨー シック

28/34

June 13, 2023

- A different track build method than DBSCAN to account for intersecting tracks
- Include MVD and GEM signals for more data

Will help increase tracking efficiency and decrease clone rate.

Outlook (II)

#### ATLAS Track Evaluation: Matching

A particle is **matched** to a reconstructed track if more than

- 50% of the hits in the reconstructed track belong to the same true particle, and
- 50% of the hits in the matched true particle is found in the reconstructed tracks.

This is a two-way matching scheme with a matching fraction (MF) > 50%.

イロト イボト イヨト イヨト

PANDA uses a similar matching scheme as of ATLAS scheme used in this work.

Particles **matched** to a reconstructed track

- Fully Purely Found, MF = 100%
- Fully Impurely Found, MF > 70%

Tracks **matched** to a true particle

- Partially Purely Found, MF = 100%
- Partially Impurely Found, MF > 70%
