The four horsemen of the Apocalypse

Theory and experiment disagree on alpha particles

Electron-scattering experiments on excited helium nuclei open questions about the accuracy and sensitivity of state-of-the-art nuclear models.

Although the helium nucleus has just four nucleons—two neutrons and two protons—theoretical models fail to replicate some of its properties.

14 PHYSICS TODAY | JUNE 2023

The researchers' calculations of a quantity related to how the nucleons are arranged in the alpha particle's first excited state didn't match the values inferred from electron-scattering experiments. The experiments were primarily from the uncertainty of the intervening data and technological sensitivity, but that

tween theory and experiment and her colleagues decided and improved experimentation was warranted. Now theory collaborators have disagreement and char

Neutron Skin of ^{208}Pb from Coherent Pion Photoproduction

C. M. Tarbert *et al.* (Crystal Ball at MAMI and A2 Collaboration)
Phys. Rev. Lett. **112**, 242502 – Published 18 June 2014

PhysiCS See Synopsis: [Neutron Skin Turns Out to Be Soft](#)

tagger at the MAMI electron beam facility. On exploitation of an interpolated fit of a theoretical model to the measured cross sections, the half-height radius and diffuseness of the neutron distribution are found to be $c_n = 6.70 \pm 0.03(\text{stat.}) \text{ fm}$ and $a_n = 0.55 \pm 0.01(\text{stat.})_{-0.03}^{+0.02}(\text{sys.}) \text{ fm}$, respectively, corresponding to a neutron skin thickness $\Delta r_{np} = 0.15 \pm 0.03(\text{stat.})_{-0.03}^{+0.01}(\text{sys.}) \text{ fm}$. The results give the first successful extraction of a neutron skin thickness with an electromagnetic probe and indicate that the skin of ^{208}Pb has a halo character. The measurement provides valuable new constraints on both the structure of nuclei and the equation of state for neutron-rich matter.

Nuclear EOS Ladder

Tantalizing Possibility

- Laboratory Experiments suggest large neutron radii for Pb $\lesssim 1\rho_0$
- Gravitational Waves suggest small stellar radii $\gtrsim 2\rho_0$
- Electromagnetic Observations suggest large stellar masses $\gtrsim 4\rho_0$

Exciting possibility: If all are confirmed, this tension may be evidence of a softening/stiffening of the EOS (phase transition?)
