Introduction to hadron physics

- Two main questions to particle physics:
 - What are the most elementary building blocks of matter?
 - What are the forces between them?

- SM is well-established theoretical description of fundamental particles and their interactions

- Building blocks:

- Quarks and leptons
- Forces mediated by exchange of gauge bosons associated with weak, electromagnetic and strong interactions

- SM is successfully tested by numerous experiments discovered a number of:
 - Non-standard hadronic** states with properties indicating their complex substructure [[PhysRept873\(2020\)1](#)]
 - Conventional** hadrons: $q\bar{q}$ mesons and qqq baryons [[PhysLett8\(1964\)214](#)]

- More than 50 years of the knowledge about CP violation (CPV)
 - Confirmed only in meson decays

- SM CPV is not sufficient to explain observed matter-antimatter asymmetry
- Baryogenesis requires C and CP violation in the processes

[PismaZh.Eksp.Teor.Fiz.5(1967)32]

- Systematical mapping with different hadronic systems and complementary methods are needed for understanding CPV in flavour sector

Measured hyperon decay parameters

- **Polarisation** of hyperons is experimentally accessible in weak parity-violating decays

- Example:
angular distribution of $Y \rightarrow BM$

$$I(\cos \theta_B) \propto 1 + \alpha_B P_y \cos \theta_B$$

- **Angle ϕ** is accessible when polarisation of daughter baryon is measured
 - Example: $Y_1 \rightarrow Y_2(\rightarrow BM)M$ like $\Xi^- \rightarrow \Lambda(\rightarrow p\pi^-)\pi^-$

CP tests in hyperon decays

- If CP conserved: $\bar{\alpha} = -\alpha$, $\bar{\beta} = -\beta$, $\bar{\phi} = -\phi$
- Possible CP tests:

weak P-S phase difference

$$A_{CP} = \frac{\alpha + \bar{\alpha}}{\alpha - \bar{\alpha}} = -\sin \phi \tan(\xi_P - \xi_S) \frac{\sqrt{1-\alpha^2}}{\alpha}$$

$$\Phi_{CP} = \frac{\phi + \bar{\phi}}{2} = \cos \phi \tan(\xi_P - \xi_S) \frac{\alpha}{\sqrt{1-\alpha^2}}$$
