

# Status of the Barrel DIRC Mechanical Design Concept

Andreas Gerhardt

Internal PANDA meeting Sept. 2013

Castle Rauschholzhausen, Germany

- Dimensions Barrel DIRC Detector
- Overview of the Mechanical Design Concept
- FEM analysis of the barbox/SciTil support structure
- Design effects of potential modifications
- Outlook – What's next.....

# Dimensions Barrel DIRC

| Expansion volume/Readout |                 |
|--------------------------|-----------------|
| Internal radius          | 448mm           |
| External radius          | 1270mm          |
| Total weight             | > 400kg         |
| z – position             | -1710...-1190mm |
| $\Delta z$               | 520mm           |

| Radiator bars/SciTiI support |                  |
|------------------------------|------------------|
| Internal radius              | 448mm            |
| External radius              | 538mm            |
| Total weight                 | > 300kg          |
| z – position                 | -1190... +1270mm |
| $\Delta z$                   | 2460mm           |
| bar dim.                     | 32x17x2400mm     |

- BaBar based design
- Supported on two CT-rails
- Support-flange of back-mounted ring shared with GEM-Tracker
- Separated SciTil- /radiator bar slots
- Homogeneous radiation length profile
- Low mass material with high stiffness preferred: CFK

- 16 barboxes populated with 5 radiator bars
- Independent SciTil boxes above barboxes
- Precise, repeatable positioning
- Boxes pre-assembled in cleanroom
- Installation with rotatable device

- Thin inner/outer sheet to reach a higher stiffness
- Shape of the sheet depends on manufacturing process etc.
- No round, precise shape needed
- Openings in outer sheet for SciTil cablings etc.

Integrated supply lines

- STT rail integrated in the expansion volume support structure

- Integrated supply lines in every guiding profile
- Usable for nitrogen-purging of all bar boxes to prevent soiling by outgassing of used materials
- Usable for a possible SciTil cooling-System

|                      |                |
|----------------------|----------------|
|                      | wall thickness |
| inner/outer sheet    | 1mm            |
| half-rings           | 10mm           |
| guiding ribs profile | 1mm            |

- Goal: maximum deformation <math><0.5\text{mm}</math>

- Stress concentrations in the corners of the slots
- More things like mounting holes, threads e.g. needed in this area

# Effects of potential modifications

## Usage of prisms as expansion volume

- Similar weight like oil volume
- More difficult to align!
- No specific mechanical design started until the decision is certified

# Effects of potential modifications

## Usage of quartz plates instead of bars

- Dimensions and weight equal to 5 bars
- Similar to align!
- Quickly integration in existing mechanical design anytime possible!

- Detector components installation procedure
- Expansion volume support frame
- Detailed design of the barbox
- CFK barbox prototyp 2014
