EMMI Workshop

Light-Ion Collisions 2026

September 21-25, 2026
Heidelberg University, Germany

credit: generated by chatGPT

Recent light-ion collision campaigns — proton-oxygen, oxygen–oxygen and neon–neon runs at the LHC, and oxygen–oxygen collisions at RHIC — have opened a transformative window onto the origins of collective behavior in small QCD systems. Simultaneously, high-energy collisions offer a novel probe of nuclear ground-state structure. Driven by these research frontiers, the 2026 EMMI Workshop on Light-Ion Collisions serves as a dedicated forum to synthesize the emerging experimental results, clarify their implications for the field, and discuss scientific cases for ion runs in LHC Run 4 and beyond.

Scientific program:

- Out-of-equilibrium QCD phenomena and onset of collectivity
- Onset of jet quenching in small and intermediate systems
- Collectivity of heavy flavors across system sizes and shapes
- Interdisciplinary connections (nuclear structure, nuclear astrophysics, neutrinoless double-beta decay, cold atoms)
- Prospects for future ion runs at LHC Run 4 and beyond

Organizers:

Reyes Alemany Fernandez (CERN)
Federica Capellino (GSI)
Andrea Dubla (GSI)
Giuliano Giacalone (CERN)
Aleksas Mazeliauskas (Heidelberg U.)
Wilke van der Schee (CERN)
Alexander Tichai (TU Darmstadt)
