Studies of Charmonium at BESIII

Tuesday, 1 September 2015 16:30 (15 minutes)

The BESIII Experiment at the Beijing Electron Positron Collider (BEPC2) has accumulated the world's largest samples of e^+e^- collisions in the tau-charm region. From these samples - which include J/ψ , $\psi(2S)$, and $\psi(3770)$ decays, among others - BESIII has produced many new results in the spectroscopy, transitions, and decays of charmonium. This talk will review the current status of these analyses, which cover a wide range of topics from rare decays to radiative transitions to new precision measurements.
