Abstract

The 12 GeV Continuous Electron Beam Facility (CEBAF) was successfully commissioned at the beginning of the year. One of the reasons commissioning went so well was due to a set of processes and tools that were put in place before commissioning began. This suite of tools were used by Operations staff, management, technicians, and engineers alike to communicate the readiness of hardware, the progress of commissioning, the state of bypassed interlocks, scheduling, work planning, and the overall readiness to run the beam to certain destinations. This talk will briefly discuss some of the most important processes and tools that were used to aid in the successful commissioning of the CEBAF Accelerator.
