Gas Flow in  $\alpha$  Detector: Inlet and Outlet Directions

**Copper cooling frame Si det at  $-80^{\circ}\text{C}$**

CANBERRA BEGe 6530:  
3cm thickness and 9cm diameter

**A. Di Nitto et al., GSI Annual report 2014  
M. Wegrzecki et al., SPIE Proc. 9291 (2014)**

# $\alpha$ -Detector

gas flow  $\rightarrow$  drift velocity

diffusion  $\rightarrow$  collision on the channel boundary

The Hg atoms are adsorbed on the surface of the detector, covered with a thin gold layer

**Distribution pattern** has a narrow peak located in the first segments  $\rightarrow$  demonstrate the retention properties, which are essential for future studies

**The large tail at low energy** is due to the use of Ar as gas carrier at high pressure (1 bar) and the Si dead-layer.

# Dead-Layer measurements

Point mixed source

$^{239}\text{Pu} = 5148 \text{ keV}$

$^{241}\text{Am} = 5480 \text{ keV}$

$^{244}\text{Cm} = 5795 \text{ keV}$

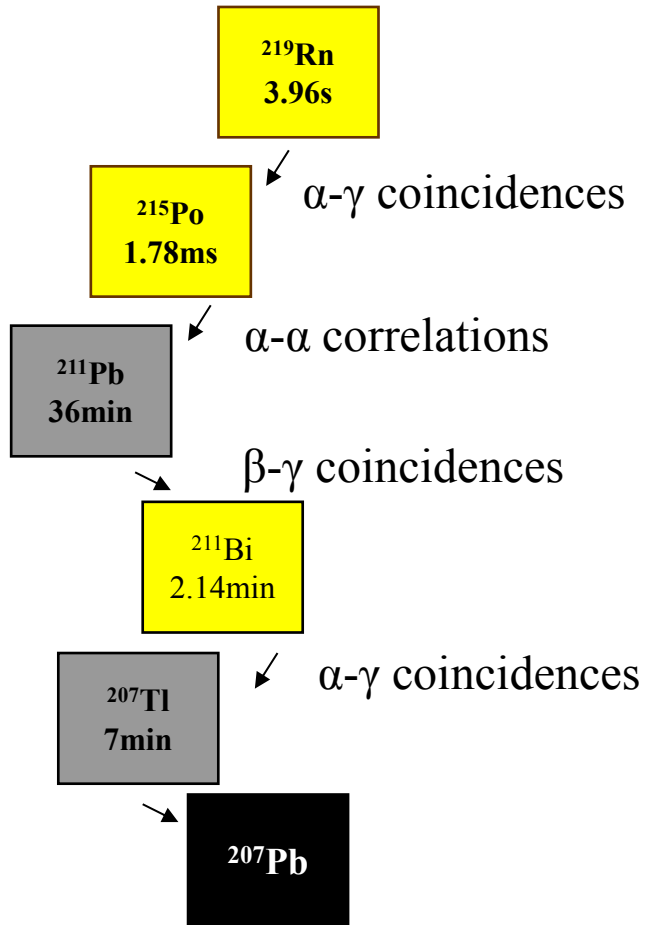

Mask with 1 mm in diameter to map the detector surface

n-side Dead-layer  $\approx 2.6 \mu\text{m}$

In agreement with manufacturing characteristics

# Calibration Source

Flushing the  $^{227}\text{Ac}$  source, the radioactive and volatile  $^{219}\text{Rn}$  is transported through the gas system to the ALBEGA.

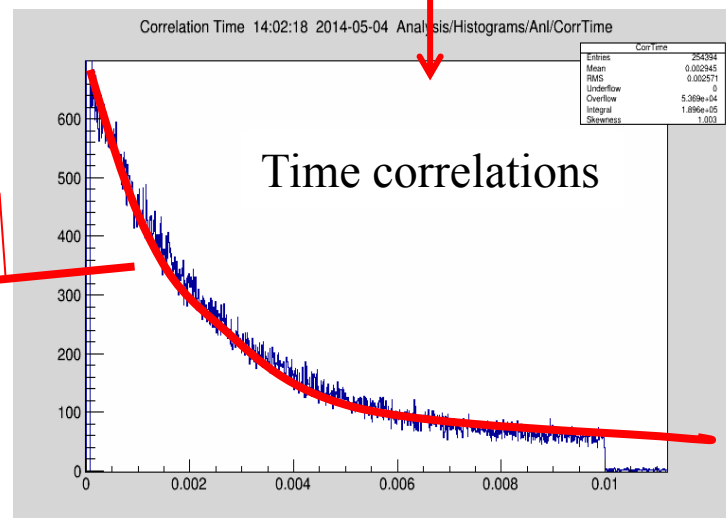

- the  $\alpha$ -particles energy  $\rightarrow$   $\alpha$ -detector calibration;
- the gamma  $\rightarrow$  BEGe calibration;
- $\alpha$ - $\gamma$  coincidences  $\rightarrow$   $\gamma$ -efficiency;
- $\alpha$ - $\alpha$  correlations  $\rightarrow$   $\alpha$ -efficiency.

# ALBEGA work conditions with Rn Source

## Energy Spectrum

## Alpha-Alpha Correlations (2 $\alpha$ -particles registered in neighbouring segments)

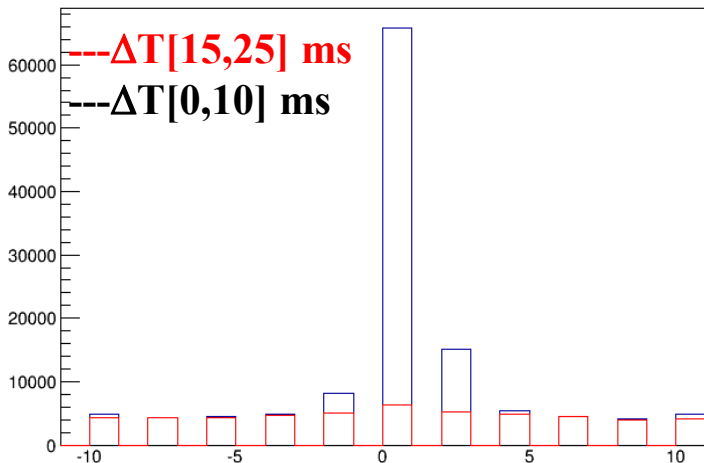

# $\alpha$ -Efficiency

**Spatial correlation**

**Time correlation ( $^{215}\text{Po}$   $T_{1/2}=1.78\text{ms}$ )**

$I_1=[0,10]\text{ms}$

$I_2=[15,25] \text{ ms}$

Real + Random corr

Random corr

$\Delta T(\text{s})$

**PRELIMINARY**

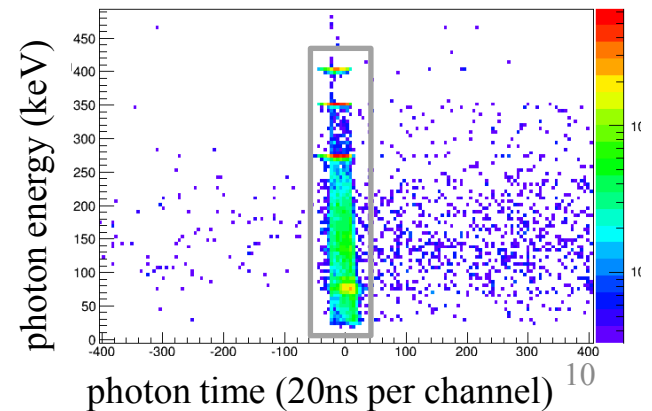

$$\varepsilon_{\alpha} = 72 \pm 8\%$$

# $\alpha$ - $\gamma$ coincidence MODE

**Slave Mode:**  
Any trigger produced  
by  $\alpha$ -detector

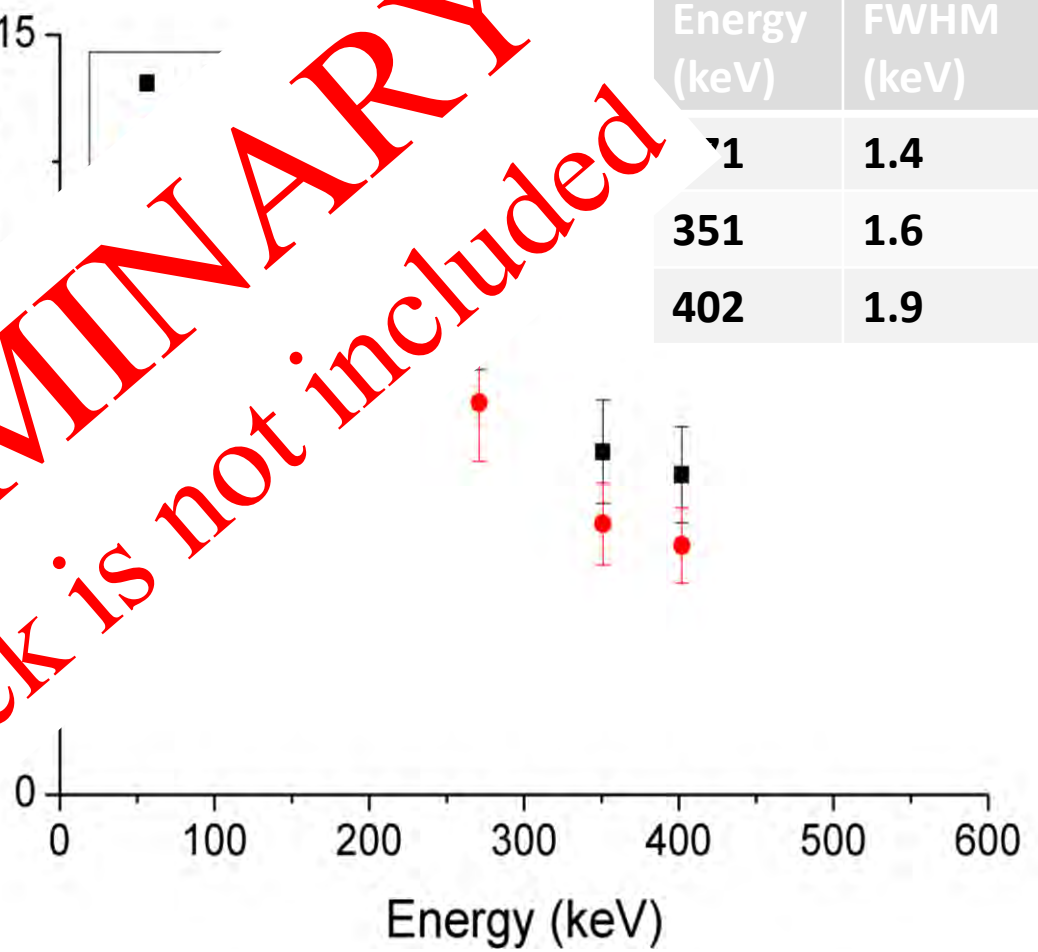

**Coincidence conditions:**  
 $\Delta T(\alpha-\gamma) < 800$  ns  
 $E\alpha > 2.5$  MeV  
1 side of  $\alpha$ -detector

# $\gamma$ - Efficiency and resolution

Efficiency (%)

Energy (keV)	FWHM (keV)
271	1.4
351	1.6
402	1.9

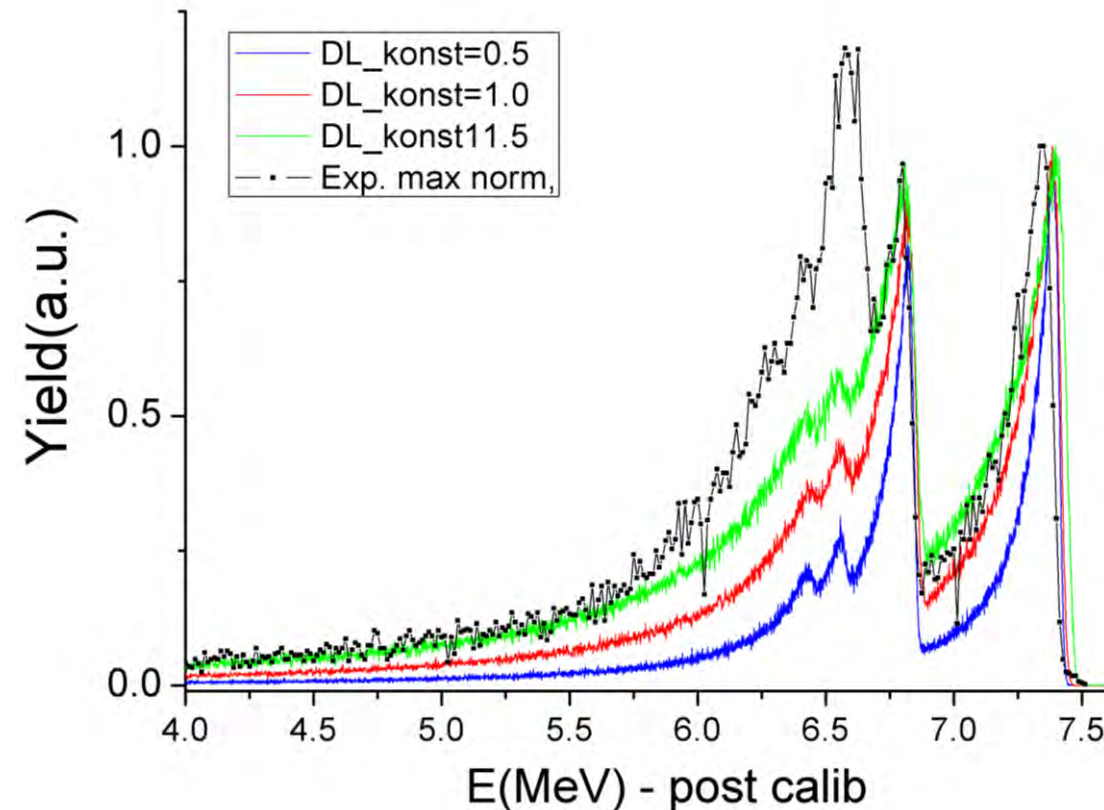

**Det2 is placed 4 mm farther than Det1 from the source**

# ALBEGA Geant4

# GEANT4: Alpha Spectrum and efficiency

Conditions	Efficiency (%)
Exp.	72 <sub>-8</sub>
Sim (DL*0.5)	90.8
Sim (DL*1.0)	84.6
Sim (DL*1.5)	78.8

## Energy lost:

- Carrier gas (Pressure and composition from the exp. Cond.);
- Si dead layer ( $2.6 \mu\text{m} * \text{DL\_konst}$  meas. with  $\alpha$ -source).

Reduction of the detection resolution and efficiency

# Ge Efficiency: Experimental conditions

## Current configuration

$d1 = 3 \text{ mm}$

$d2 = 2 \text{ mm}$

$C_{\text{thick}} = 0.6 \text{ mm}$

$\beta 1: d=11.45 \rightarrow X=20.2$

$\beta 1: d=15.45 \rightarrow X=24.2$

$E_\gamma$ (keV)	Det1 Exp.	sim 20 mm	Det2 Exp.	$\epsilon_{\text{sim}}$ 24 mm
271	9.9+1.5	12	7.74±1.2	9.5
351	6.8+1.0	--	5.35±0.8	--
402	6.3+0.9	8.5	4.92+0.7	7.5

x (mm)	Total $\epsilon$ (%) ( $E_g=271 \text{ keV}$ )	Total $\epsilon$ (%) ( $E_g=402 \text{ keV}$ )
12	31	22
20	24	17
24.25	19	15

**Future Core detector (under study):**  
 $d < 4 \text{ mm} \rightarrow \epsilon > 30\%$

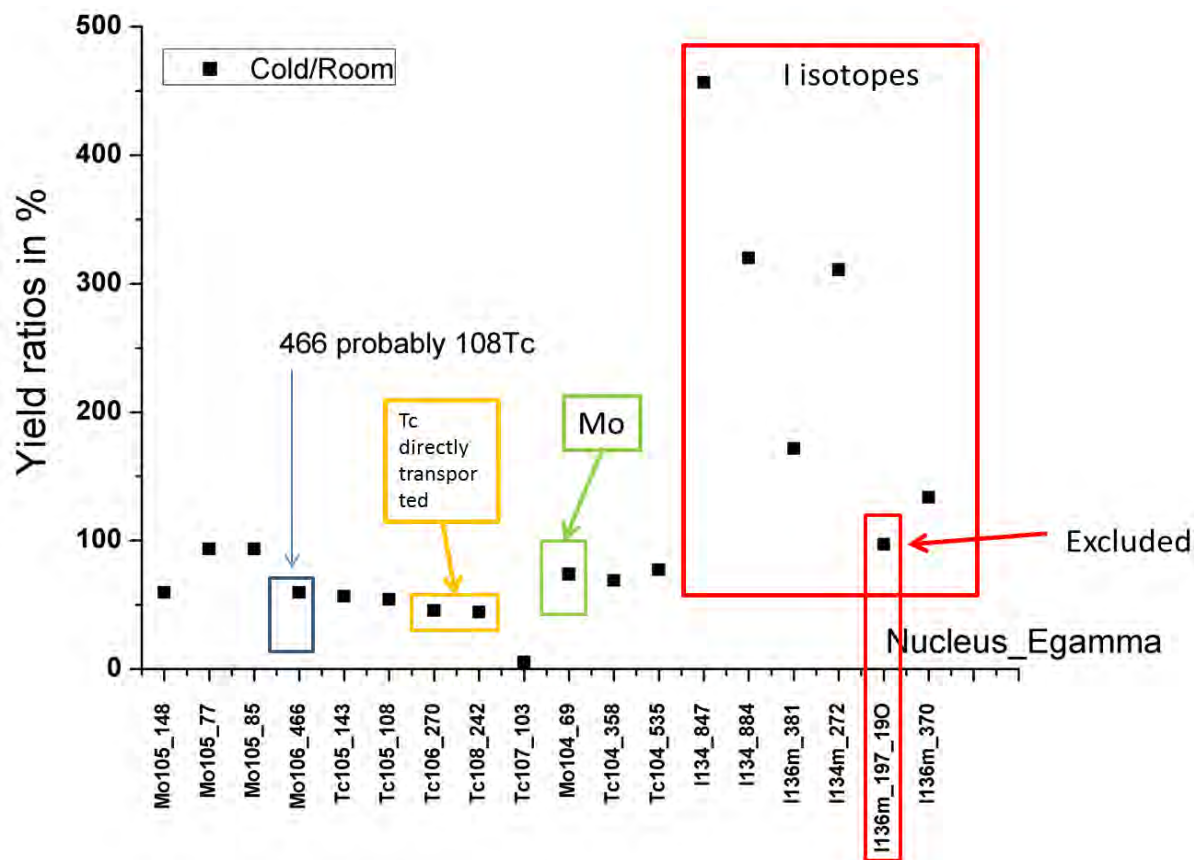

# ALBEGA@TRIGA Mainz

Gas flow composition: CO:N<sub>2</sub>=1:1

Flow rate: 1L/min

# Mo/Tc/I adsorbed on ALBEGA surface

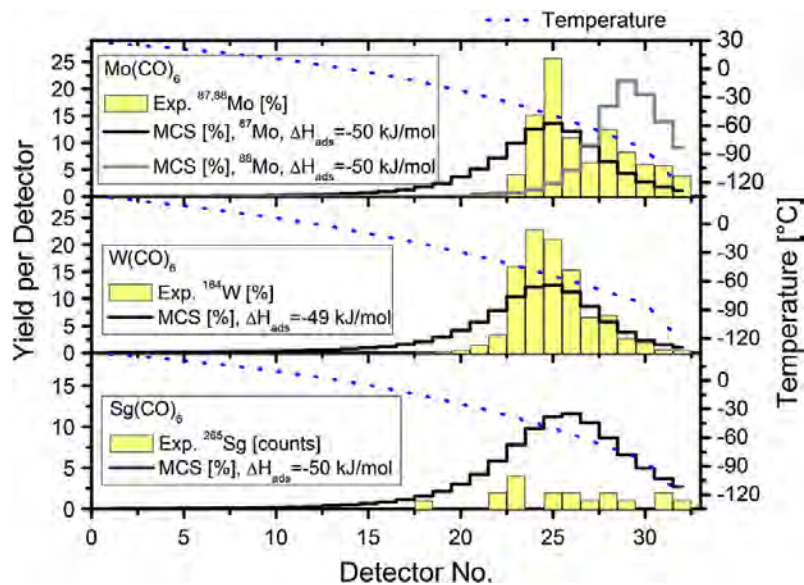

The Core detector connected with a Chiller at  $-80^{\circ}$

**$^{106}\text{Tc}$  ( $T_{1/2}=36\text{ s}$ ):** I excluded the presence of  $^{106}\text{Mo}$  therefore this peak can be considered as Tc directly transported. It disappears in the decay files.

**$^{104}\text{Mo}$  ( $T_{1/2}=1\text{ m}$ ):** produced by the Mo transported. This peak disappears in the decay files.

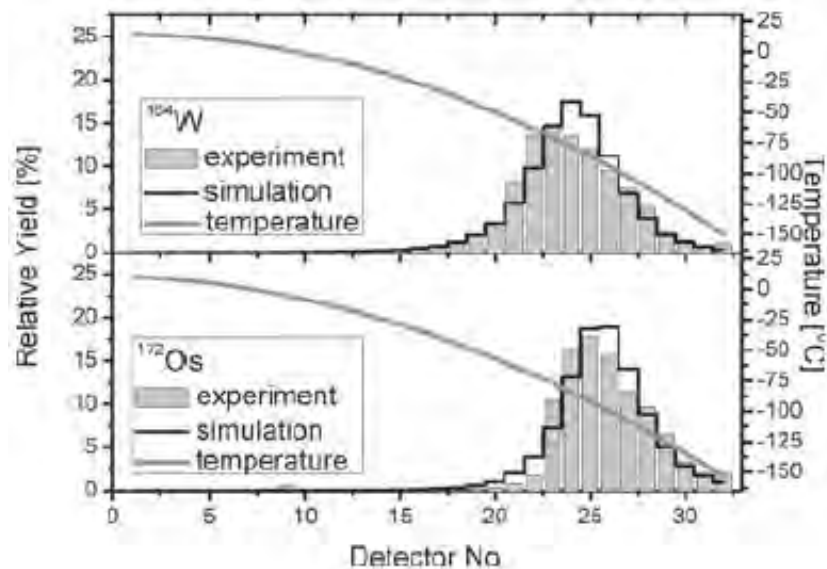

# ALBEGA Temperature

## COMPACT SiO<sub>2</sub>

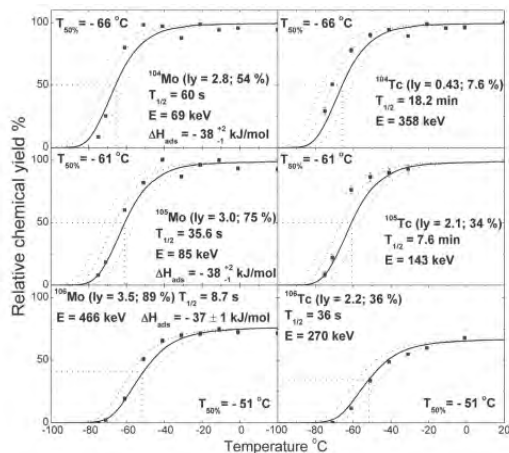

*J.Even Radioanal Nucl Chem (2015) 303:2457–2466*

## COMPACT Au

*J.Even Radichim. Acta (2014) 102:1093-1110*

Breakthrough curves from literature obtained using Teflon or Quarz IC columns the temperature values are:

$$74\% \text{ } ^{104}\text{Mo} \rightarrow -58^\circ\text{C}$$

$$45\% \text{ } ^{106}\text{Tc} \setminus ^{108}\text{Tc} \rightarrow -40^\circ\text{C}$$

*Y. Wang et al. Phys.Chem.Chem.Phys.(2015)*

# $\gamma$ - $\gamma$ coincidences

Case2  $\rightarrow$   $\gamma$ - $\gamma$  coincidences: TRIGA@Mainz

# Outlook

Future developments and plans:

- Full implementation of ALBEGA in GEANT4;
- New core detector for optimization of  $\alpha$ -particle detection efficiency and resolution (reduction of the dead-layer);
- Improving the mechanical stability;
- Increasing the Ge-detectors geometrical efficiency and optimize the resolution;

**Thank you for your attention**
