

Symposium on dense baryonic matter

March 8–9, 2009, GSI

# Physics in the vicinity of the hadronization phase transition

Reinhard Stock, Goethe University Frankfurt

# Consequences for the phase diagram:

C. Schmidt, QM08

## the radius of convergence

- the radius of convergence can be estimated by the Taylor coefficients of the pressure:

$$\rho = \lim_{n \rightarrow \infty} \rho_n$$

with

$$\rho_n = \sqrt{\frac{c_n^B}{c_{n+2}^B}}$$

- for  $T > T_c$ ,  $\rho_n \rightarrow \infty$
- for  $T < T_c$ ,  $\rho_n$  is bound by the transition line

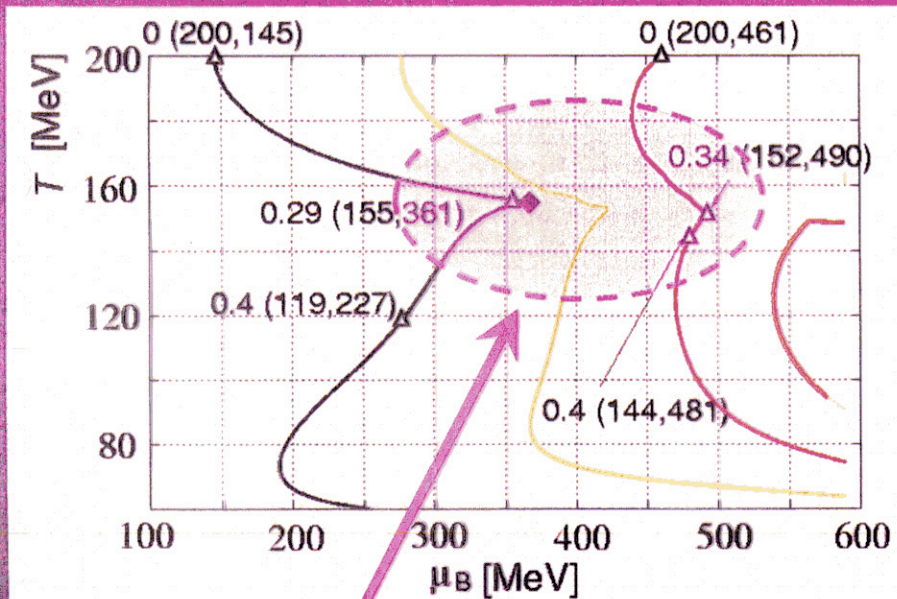

- non monotonic behavior of the convergence radius

- higher order approximations are needed to locate the critical point

→ **first hint for a critical region ?**

# With Large Critical Region

with CEP

Focusing of Isentropic Trajectories

without CEP (EOS in usual hydro calculation)

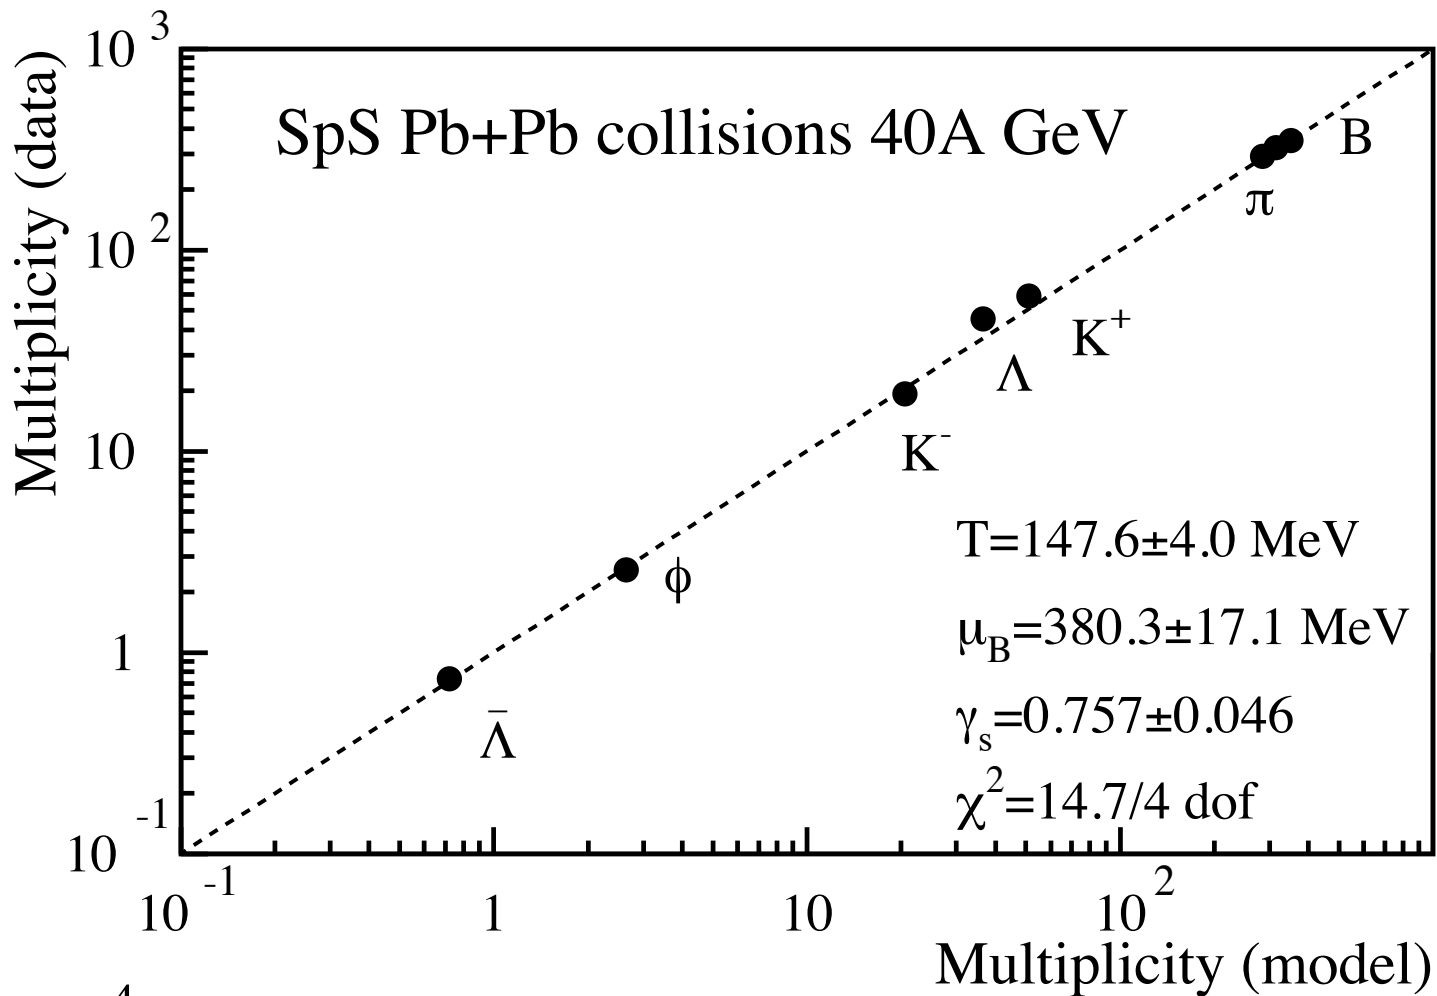

Excluded Volume Approximation  
+ Bag Model EOS

used in most hydro calculations

## K/p dynamical fluctuations at SPS

$\sigma_{\text{dyn}}(\text{K/p})$  related to

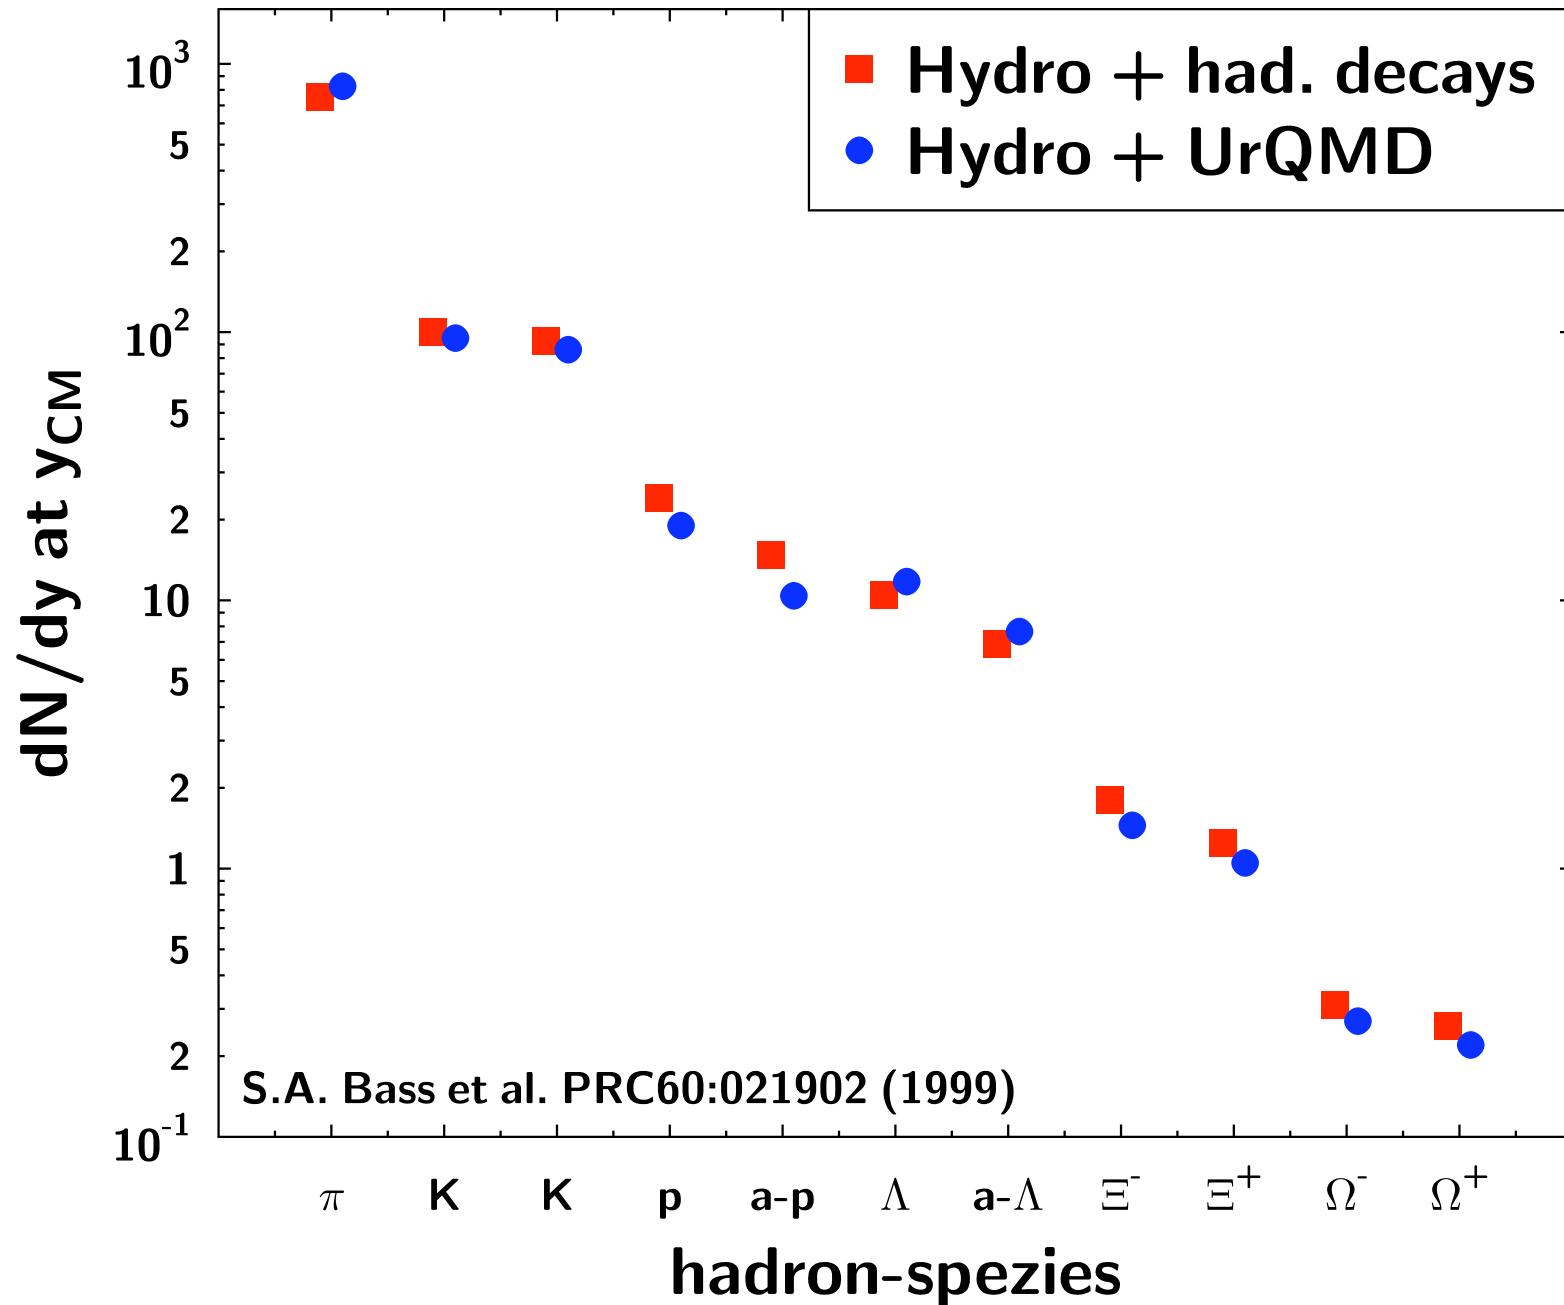

$$C_{BS} = 1 + \frac{\chi_{us} + \chi_{ds}}{\chi_{ss}}$$

V. Koch et al.

PRL 95, 2005, 182301

# Au+Au at RHIC

# Sequential chemical freeze-out

- Hadronic evolution at  $\sqrt{s} < 10$  GeV:
- higher  $\rho/\rho_0$ , slower expansion
- new scenario!
- Determine  $T_C \leq T_{F-O}(\Omega) \leq \dots \leq T_{F-O}(\pi, N)$ ?

In addition: chiral restoration and critical point
