QED calculations of the binding energies in highly charged ions

Monday, 19 September 2016 17:10 (25 minutes)

The approach for the calculation of the binding energies in highly charged ions is presented. The method merges ab initio QED treatment in the first and second orders of the perturbation theory in the fine-structure constant with the third- and higher-order electron-correlation contributions evaluated within the Breit approximation. The nuclear recoil and nuclear polarization effects are taken into account.
