Summary of the previous presentation at PANDA LV. Meeting - Vienna

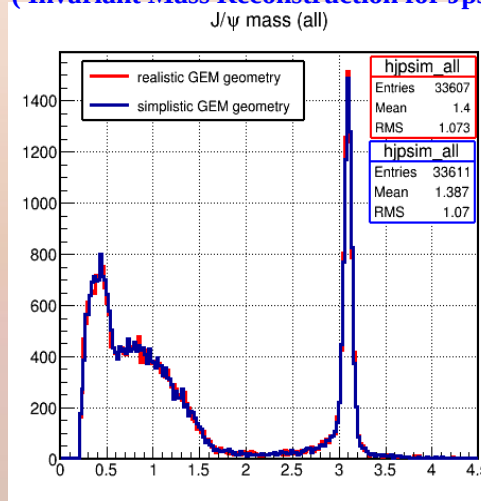

(realistic GEM geometry on the ROOT)

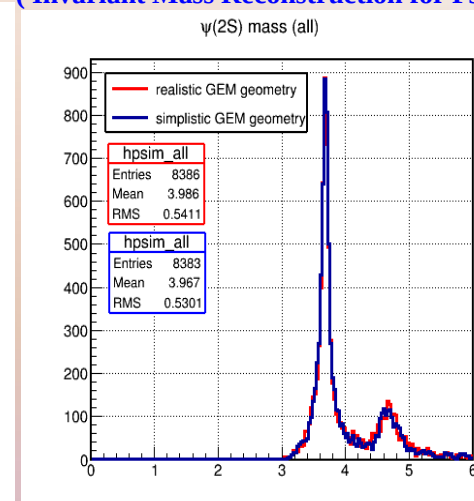

(GEM hits pattern for a station)

(Invariant Mass Reconstruction for Jpsi)

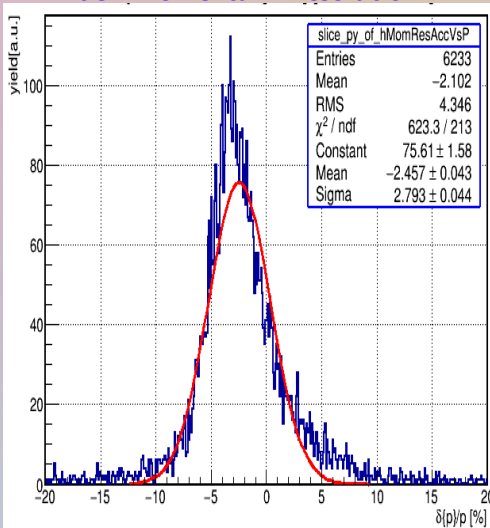

(Invariant Mass Reconstruction for Psi)

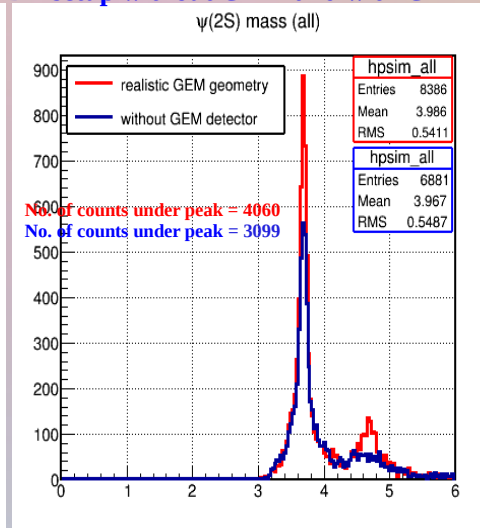

Track Efficiency vs Momentum

Track Momentum Resolution

Comparison between two cases: PANDA setup without GEM and with GEM

Summary of the previous presentation (conclusion and outlook)

As the Conclusion :

- The realistic geometry of GEM for PANDARoot was almost ready
- Materials for supporting structures and cooling devices didn't increase background in the invariant mass reconstruction histograms
- With realistic GEM geometry, mass resolution and tracking acceptance were improved
- To emphasize of the GEM role on the PANDA setup, in the current tracking class PndSttMvdGemTracking, improvement by adding GEM should be separated from the other contributions

As the Future Tasks :

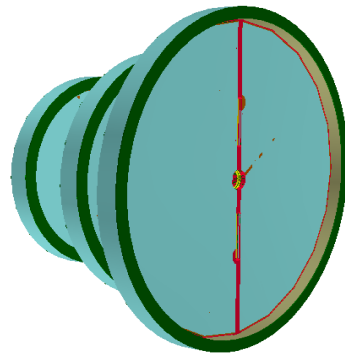

- Implement more realistic geometries such as electronics modules, cables and connectors
- Check extrusions and overlaps for inner GEM parts and between GEM and its neighbors
- Upload the realistic GEM geometry to the repository of the PandaROOT framework
- Separate contributions by GEM from the other contributions and implement MVD+GEM tracking
- Investigate the invariant mass reconstruction for the other physics benchmark channels

More completion of GEM geometry : Adding some parts as the electronic devices

Adding electronic modules in copper

Covering ring in glass fiber

Adding cables in copper as big as possible

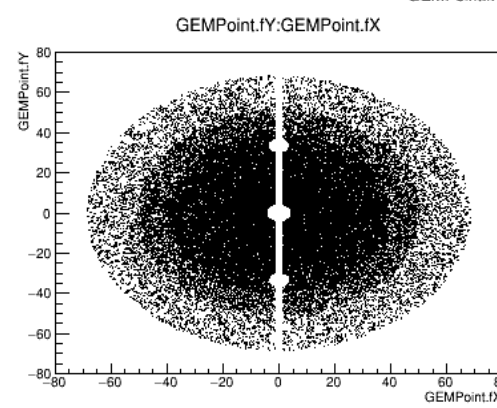

Fitting the Riddle shell without any contact

GEM Points (X,Y,Z)

GEM hits pattern for a station and all stations

GEMPoint.fY:GEMPoint.fZ

GEM hits pattern for three stations Z=119.4 , 155.4 , 188.5 cm

GEMPoint.fY:GEMPoint.fX:GEMPoint.fZ

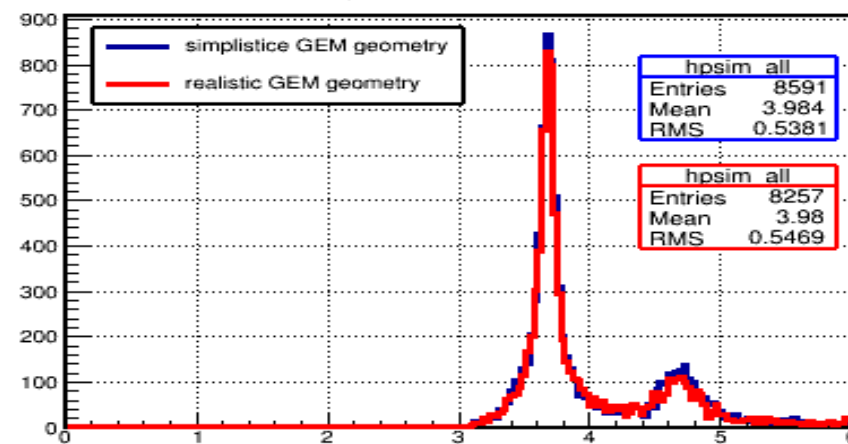

Investigation of Invariant Mass Reconstruction

Benchmark channel including $\text{antip} + \text{p} \rightarrow \Psi(2S) \rightarrow \text{J}/\Psi(1S) \pi^+ \pi^-$, then J/Ψ into μ^+ and μ^- (muonic decay) mass of the $\Psi(2S)$ and $\text{J}/\Psi(1S)$ are respectively $3686.109 \pm 0.012 \text{ MeV}/c^2$, $3096.916 \pm 0.011 \text{ MeV}/c^2$

J/ Ψ mass (all)

$\Psi(2S)$ mass (all)

J/ Ψ mass (tight pid)

$\Psi(2S)$ mass (tight pid)

Geometry Completing – Overlap Checking – Repository Updating

- Therefor, we could do these steps up to now :
- Implemented more realistic geometries such as electronics modules, cables and connectors -----> **The geometry could be changed**

The result are acceptable

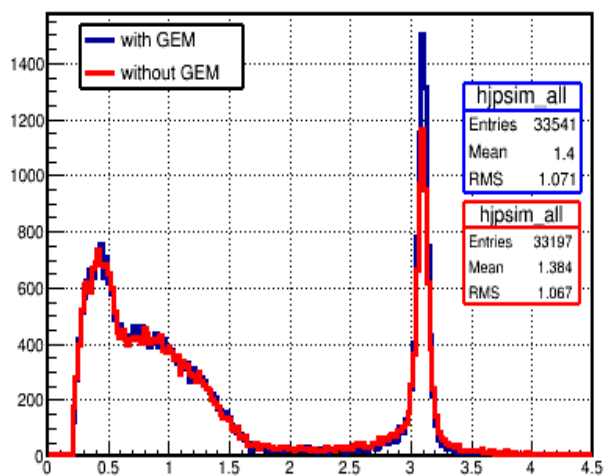

Realistic GEM geometry and extra materials do not disturb reconstructing

- Checked extrusions and overlaps once again for inner GEM parts and between GEM and its neighbors -----> **It seems there is no overlap**
- Uploaded the realistic GEM geometry to the repository of the PandaROOT framework -----> **trunk/macro/gem@revision28834 , (27/01/2016)**
create3stationsGem.C: gem_3Stations_realistic_v1.root
gem_3Stations_realistic_v1.digi.par

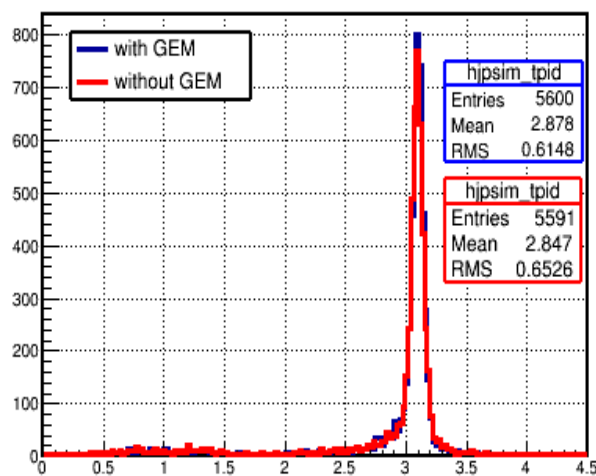

Comparison between two cases: PANDA setup with and without GEM

using PndSttMvdGemTracking current class for track reconstruction.

J/ψ mass (all)

J/ψ mass (tight pid)

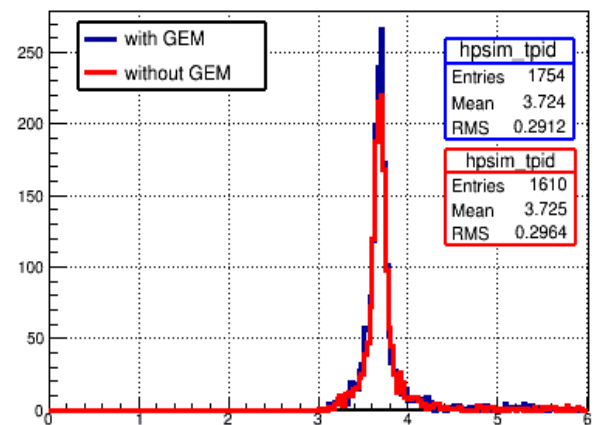

J/ψ mass (loose pid)

ψ(2S) mass (all)

ψ(2S) mass (tight pid)

ψ(2S) mass (loose pid)

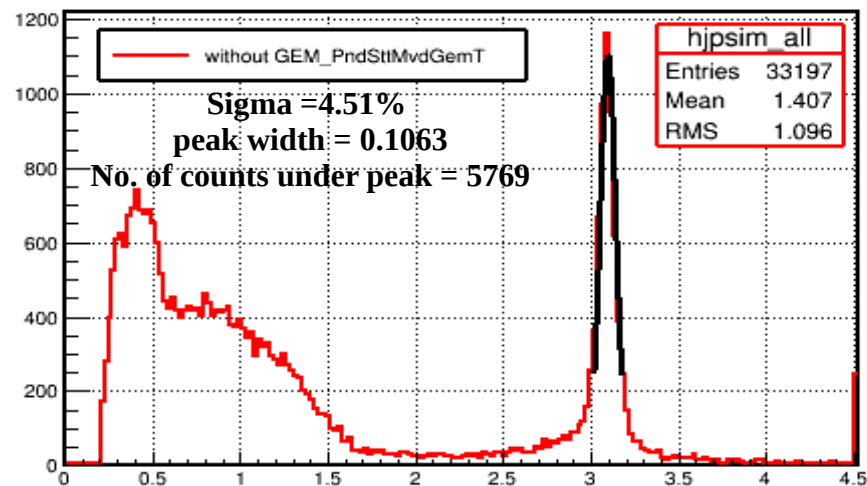

Results for PANDA setup with and without GEM using PndSttMvdGemTracking

J/ψ mass (all)

ψ(2S) mass (all)

ψ(2S) mass (all)

Study about changing track reconstruction class

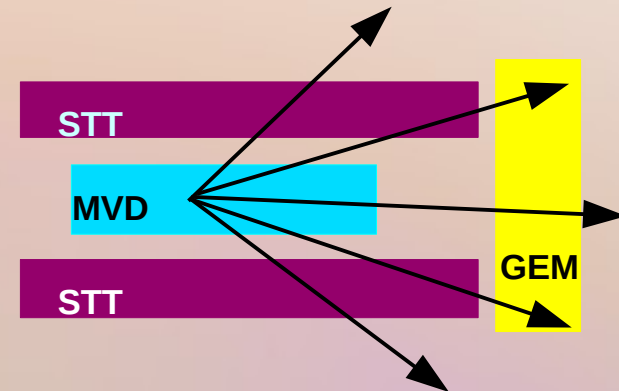

Benchmark channel including $\text{antip} + \text{p} \rightarrow \Psi(2\text{S}) \rightarrow \text{J}/\Psi(1\text{S}) \pi^+ \pi^-$, then J/Ψ into μ^+ and μ^- (muonic decay)

Comparison between two track reconstruction classes :

PndSttMvdGemTracking

- Current tracking class in the framework is **PndSttMvdGemTracking**
 - Tracking procedure always uses hits in **STT and MVD**
 - GEM hits are used for track improving when they exist
 - Contributions with STT+MVD & GEM coincidence is not large

PndBarrelTrackFinder

- Another tracking class in the framework is **PndBarrelTrackFinder**
 - Tracking procedure always uses any hits in **STT and MVD and GEM**
 - GEM hits are counted for track finding simultaneously
 - Contributions with STT+MVD & GEM coincidence is good

Comparison between two cases: PANDA setup with and without GEM

using PndBarrelTrackFinder class for good track reconstruction

J/ψ mass (all)

J/ψ mass (tight pid)

J/ψ mass (loose pid)

ψ(2S) mass (all)

ψ(2S) mass (tight pid)

ψ(2S) mass (loose pid)

Results for PANDA setup with and without GEM using PndBarrelTrackFinder

J/ ψ mass (all)

J/ ψ mass (all)

$\psi(2S)$ mass (all)

$\psi(2S)$ mass (all)

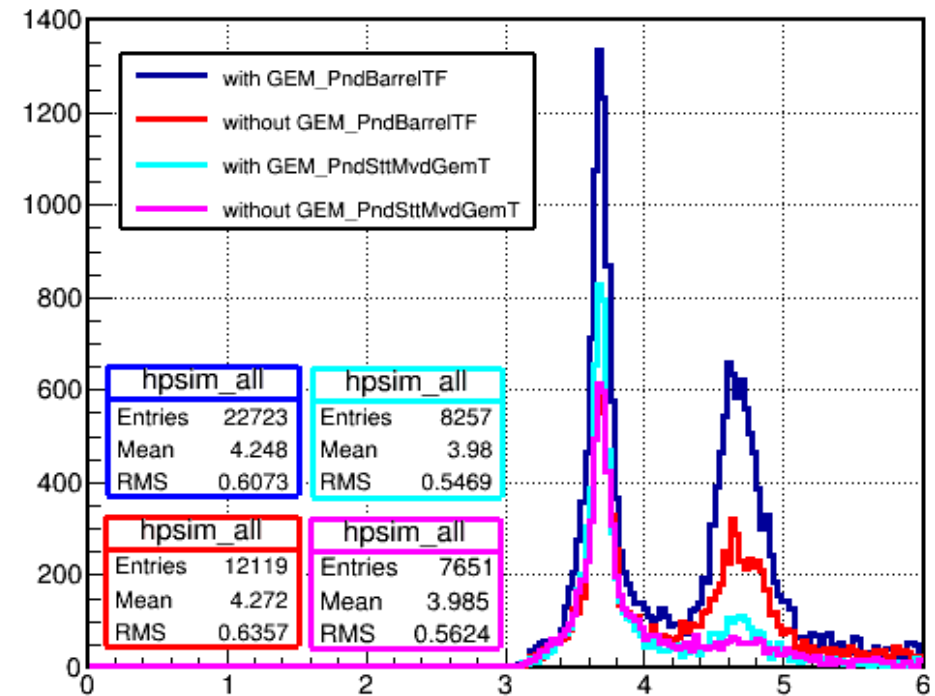

Comparison between two cases: PANDA setup with and without GEM

Comparison between two track reconstruction class : [PndSttMvdGemTracking](#) with [PndBarrelTrackFinder](#)

J/ψ mass (all)

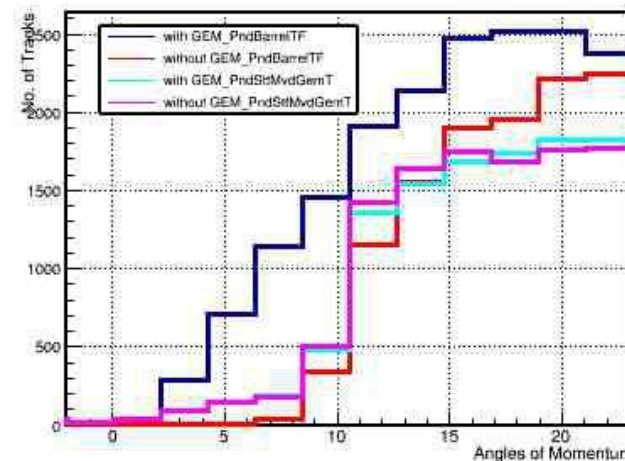

ψ(2S) mass (all)

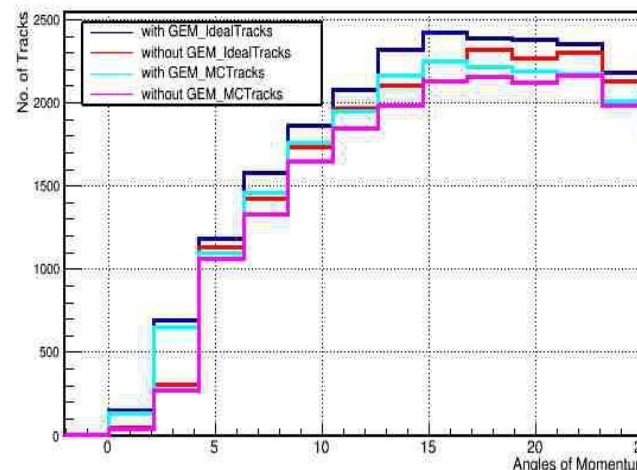

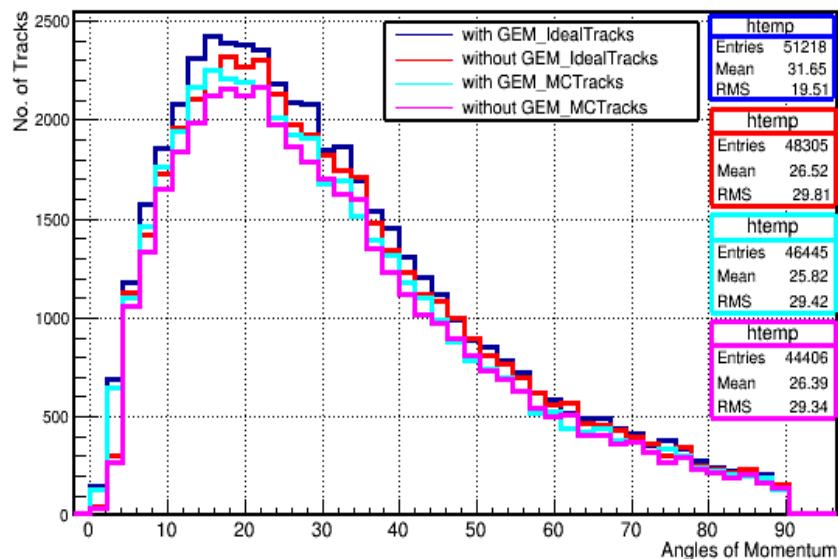

We have difference between using PndBarrelTrackFinder and PndSttMvdGemTracking. It seems using PndBarrelTrackFinder can be beneficial and the results look quite reasonable. With the PndBarrelTrackFinder there is much more entries than in the PndSttMvdGemTracking. There is a big peak at the background region that maybe comes from low momentum particles.

Comparison between two track reconstruction class : PndSttMvdGemTracking with PndBarrelTrackFinder

The important thing seen from this plot is that using PndBarrelTrackFinder can help to show GEM covers the small angles region, below 20 degrees better than the another cases.

Comparison between two track reconstruction class : PndSttMvdGemTracking with PndBarrelTrackFinder

Momentum Resolution

Momentum Resolution

Although momentum resolution doesn't improve by using PndBarrelTrackFinder class, it could be useful to reconstruct tracks in forward directions.

Comparison between all of the contributions using PndBarrelTrackFinder

J/ψ mass (tight pid)

ψ(2S) mass (tight pid)

J/ψ mass (loose pid)

ψ(2S) mass (loose pid)

Comparison between all of the contributions using PndBarrelTrackFinder

J/ψ mass (all)

ψ(2S) mass (all)

By using the PndBarrelTrackFinder class , separation between contributions have been done.

Comparison between two track reconstruction class : PndSttMvdGemTracking with PndBarrelTrackFinder

Even though current track reconstruction class **PndSttMvdGemTracking** has a better quality of track finding than the another one, using **PndBarrelTrackFinder** class has been more beneficial in order to prove our discussion about the influence of GEM on the PANDA setup.

Conclusion

- **The geometry in the MC simulation has been updated**
- **Additional materials in the realistic GEM geometry with 3 stations do not disturb the invariant mass reconstruction**
- **With realistic GEM geometry, mass resolution and tracking acceptance are better than those without GEM**
- **Using PndBarrelTrackFinder class can show :**
 - **the differences between the results better than using PndSttMvdGemTracking current class in case of PANDA setup with and without GEM**
 - **the GEM can cover the angles below 20 degrees better than those without GEM**
- **With realistic GEM geometry total momentum resolution will improve**

Future Tasks

- Overall look to check and fix all of the details at the GEM geometry
- Implement GEM geometry only for one station (**next talk**)
- Investigate the invariant mass reconstruction for the other physics benchmark channels
- Wait for GEM prototype

Many Thanks For Your Attention

GEM stations materials:

- The stations are in form of circular planes (Disk shape) → HalfStationThickness = 7.4 cm
- The stations are full of ArCO₂ gas
- Separately , each station has 2 Gem_Sensor_GEMmixture (ArCO₂ gas) that each one has 1.0020 cm thickness
- The total thickness of each station only for layers is 5.8864 cm
- Totally , each station includes: 0.0338 cm of kapton, 0.0006 cm of aluminium & 0.008 cm of copper (for main layers), 1.84 cm of glass fiber & 2 cm of carbon (for holding structure layers) , ...

GEM Track Efficiency and Track Momentum Resolution

GEM Digitizer : Summary

Events: 10000
