Darmstadt, 2016
CBM experiment

- Fixed-target heavy-ion experiment
- $10^7$ Au+Au collisions/sec
- Double-sided strip detector (85% fake space-points)
- Input data is not divided into events
The CBM beam: no bunch structure
Interaction rate up to 10 MHz

- Big amount of data
- Overlapping events
- Multiple-fired strips
Time-based cluster finding

STS cluster is a set of strips with neighboring channel numbers.

Data structure:
- Access by the channel number
- Fast data sorting
- Not unique channel numbers

```plaintext
multimap

DATA

Channel N

pair

CbmStsDigi*

Digi Index

Automatically sorted by channel number
```
Clustering algorithm

1. Take first digit from *multimap*
2. Start new cluster
3. Take next digit from *multimap*
4. Correct time and channel
5. Correct charge
6. Next channel
7. Add digit to cluster
8. Delete digit from *multimap*
9. Finish cluster

*Optional*
Time-based hit finding

- Standard hit finder can be used in non-parallel reconstruction.
- Additional time check should be added.
- Two clusters create hit only if $|t_{\text{cluster}_1} - t_{\text{cluster}_2}| < dt$
Number of objects / Efficiency

- 1000 minimum bias Au+Au events at 25 GeV
- Time slice – 10000 ns

Events

- Matched Hits: 54.7%
- Efficiency: 98.3%
- Ghost: 81.3%

Time Slices

- Matched Hits: 52.8%
- Efficiency: 97.4%
- Ghost: 97.1%
Size of clusters

Digis which were produced by Point on the sensor side.

Digis which correspond to each cluster.

Cluster size distributions are mostly the same. The number and size of clusters correspond to the Monte Carlo data.
- Calculation time increasing accordantly to the number of digis
- Sensors can be processed independently from each other
- The algorithm can be accelerated by parallelization
Cluster and hit finding

- 100 mbias AuAu events at 25 GeV;
- Time Slice duration: 1000 ns;
- Interaction rate: 100 MHz;

Digis

Clusters

Hits
Conclusions

- Time-based cluster finder for the STS detector was developed.

- Event-bases hit finder with time check can be used for time slices as well as for events.

- Efficiency and speed of the new clustering correspond to the performance of the standard event based cluster and hit finders.

Thank you for your attention!
