dE/dx discussion

electronic stopping power $\sim \beta$
non-ionizing interactions

Minimum at $\beta\gamma \approx 3.0 - 3.5$
 \rightarrow minimum ionizing particle (MIP)

$$\left\langle \frac{-dE}{dX} \right\rangle \approx K Z^2 \frac{1}{\beta^2} \frac{Z}{A} \left[\ln \frac{2c^2 \beta^2 m_e \gamma^2}{I^2} - \beta^2 - \frac{\delta}{2} - \frac{C}{Z} \right]$$

dE/dX only dependent of velocity and not from mass → particle identification

Heavy particles:

- dE/dx well described by Bethe-Bloch-Formula
- Ionization and excitation of target electrons

Electrons do not obey the Bethe-Bloch-Formula

Cherenkov radiation is emitted when a charged particle passes a dielectric medium with velocity $\beta \geq \beta_{thr} = \frac{1}{n}$ n : refractive index

→ the particle is faster than the group velocity of light in the medium

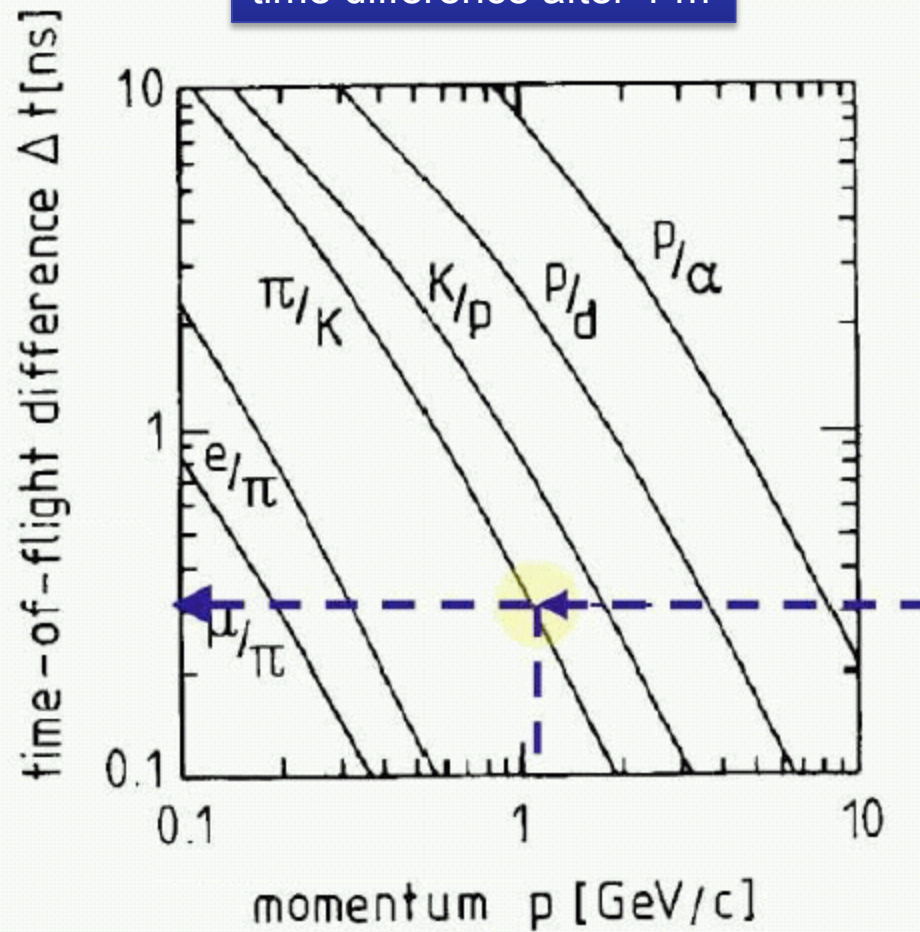

$$\cos \theta_C = \frac{1}{n\beta} \quad \text{with } \underline{n = n(\lambda) \geq 1}$$

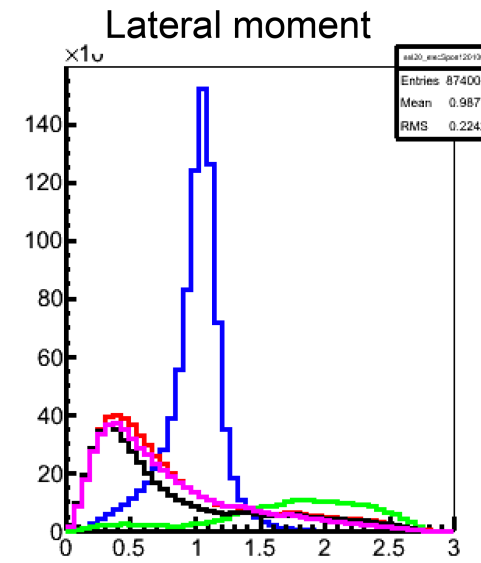

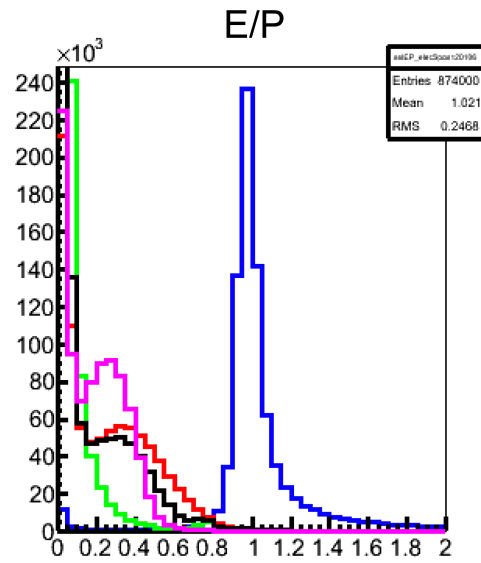

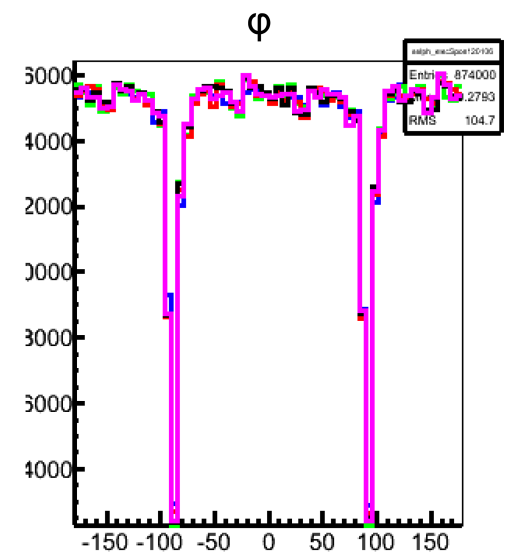

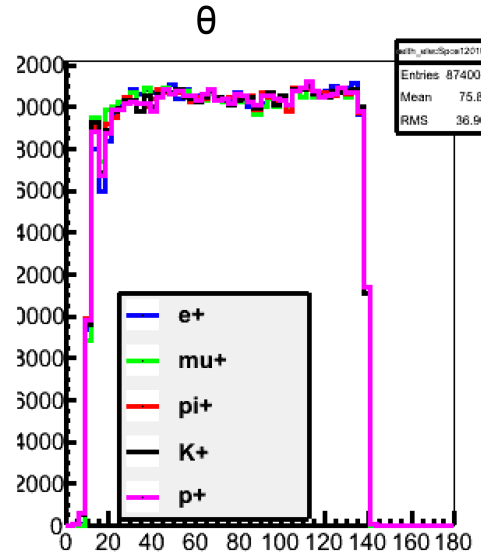

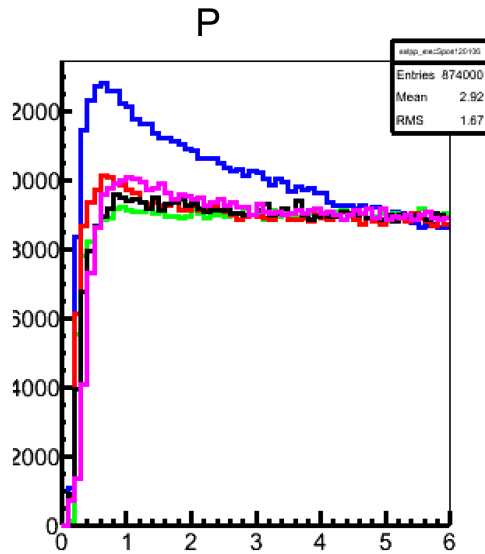

$$\beta_{thr} = \frac{1}{n} \quad \rightarrow \quad \theta_C \approx 0 \quad \text{threshold}$$

$$\theta_{max} = \arccos \frac{1}{n} \quad \text{saturated angle}$$

time difference after 1 m

time resolution 300 ps
→ Kaon-pion separation up to
1 GeV/c for $L = 3$ m

Summary of PID techniques

- A number of powerful methods are available to identify particles over a large momentum range.
- Depending on the available space and the environment, the identification power can vary significantly.

A very coarse plot

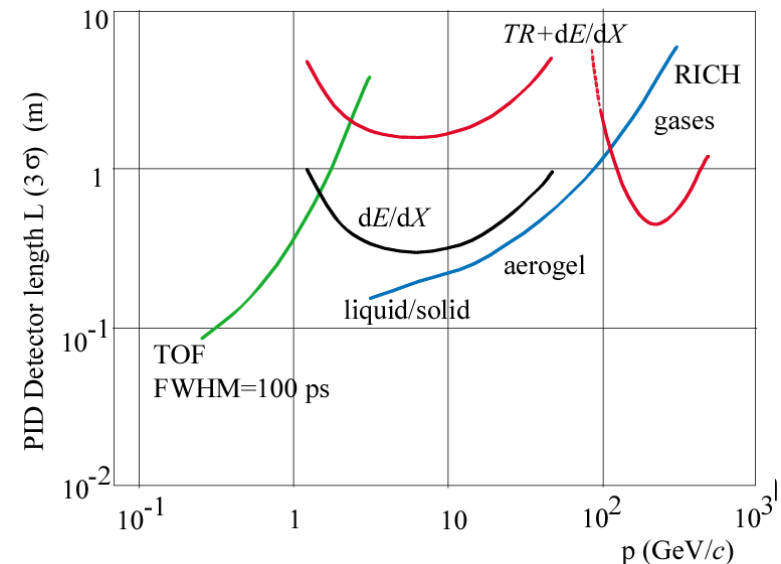

e^\pm identification

π/K separation

Pion-Kaon separation for different PID methods.

The length of the detectors needed for 3σ separation.

different detectors for PID
covering
different momentum/angle ranges

MVD, TPC/STT, Cherenkov, EMC, MDT...

- handling of different PID signals (dE/dx , θ_C , EMC shower, ...)
- combining several PID detectors to improve identification
- if one detector does not contribute to PID, it should not decrease the identification performances

Requirements for Particle Identification (II)

- handling of different PID signals (dE/dx , θ_C , EMC shower, ...)
- combining several PID detectors to improve identification
- if one detector does not contribute to PID, it should not decrease the identification performances

- PID procedure should be as much as possible **automatic**
- PID depends also on **analysis**

we need to separate

- **Detector response (i.e. resolution)**
- **Event/track selection (analysis)**

Probability Density Function

a function that describes the relative likelihood for a random variable to occur at a given point in the observation space (Wikipedia)

i.e. Gaussian distribution

Probability Density Function

probability to find a variable in a given range [a,b]

$$P[a, b] = \frac{\int_a^b p(x) dx}{\int_{-\infty}^{+\infty} p(x) dx}$$

Probability Density Function - II

gaussian distributions

For each particle hypothesis calculation of (normalized) pdf

- from simulation
- from experimental data

x – signal (p, dE/dx, θ_c...)

h – particle hyp (e, μ, π, K, p)

$p(\vec{x}, h)$

depends on detector response

If many detectors/algorithms contributing to PID

Global Likelihood

$$L(\vec{x} | h) = \prod_k p_k(\vec{x} | h)$$

k = MVD dE/dx, DRC θ_C ...

Probability that a given track with given params \mathbf{x} corresponds to particle type h

$$P(\vec{x} | h) = \frac{L(\vec{x} | h) \times P(h)}{\sum_{h=e, \mu, \pi, K, p} L(\vec{x} | h) \times P(h)}$$

The Bayes Theorem - II

$$P(\vec{x} | h) = \frac{L(\vec{x} | h) \times P(h)}{\sum_{h=e, \mu, \pi, K, p} L(\vec{x} | h) \times P(h)}$$

$P(h)$

apriori probability to find the particle kind **h** in the detector

$P(h)$ depends only on track/event selection

Algorithms: Bayesian Method

particle flux

Global Likelihood

$$L(\vec{x} | h) = \prod_k p_k(\vec{x} | h)$$

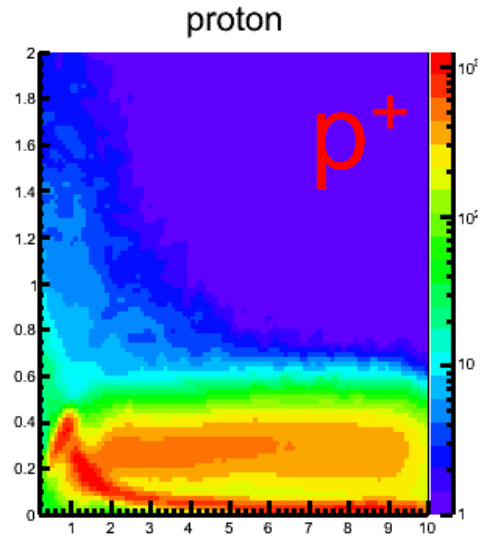

← algorithms

$$P(\vec{x} | h) = \frac{L(\vec{x} | h) \times P(h)}{\sum_{h=e, \mu, \pi, K, p} L(\vec{x} | h) \times P(h)}$$

in EMC

Things to do: Reconstruction

- Validate momentum reconstruction for different particle kinds
- Validate momentum reconstruction for different particle hypothesis (kalman)
- Study and improve track correlation (momentum-wise?)

Things to do: Reconstruction

- Improve and make faster the correlation
- Proper set of correlation windows, as a function of momentum?
- Study and improve the anti-correlation for neutrals
- Correlation with forward PID detector is almost missing
- ...

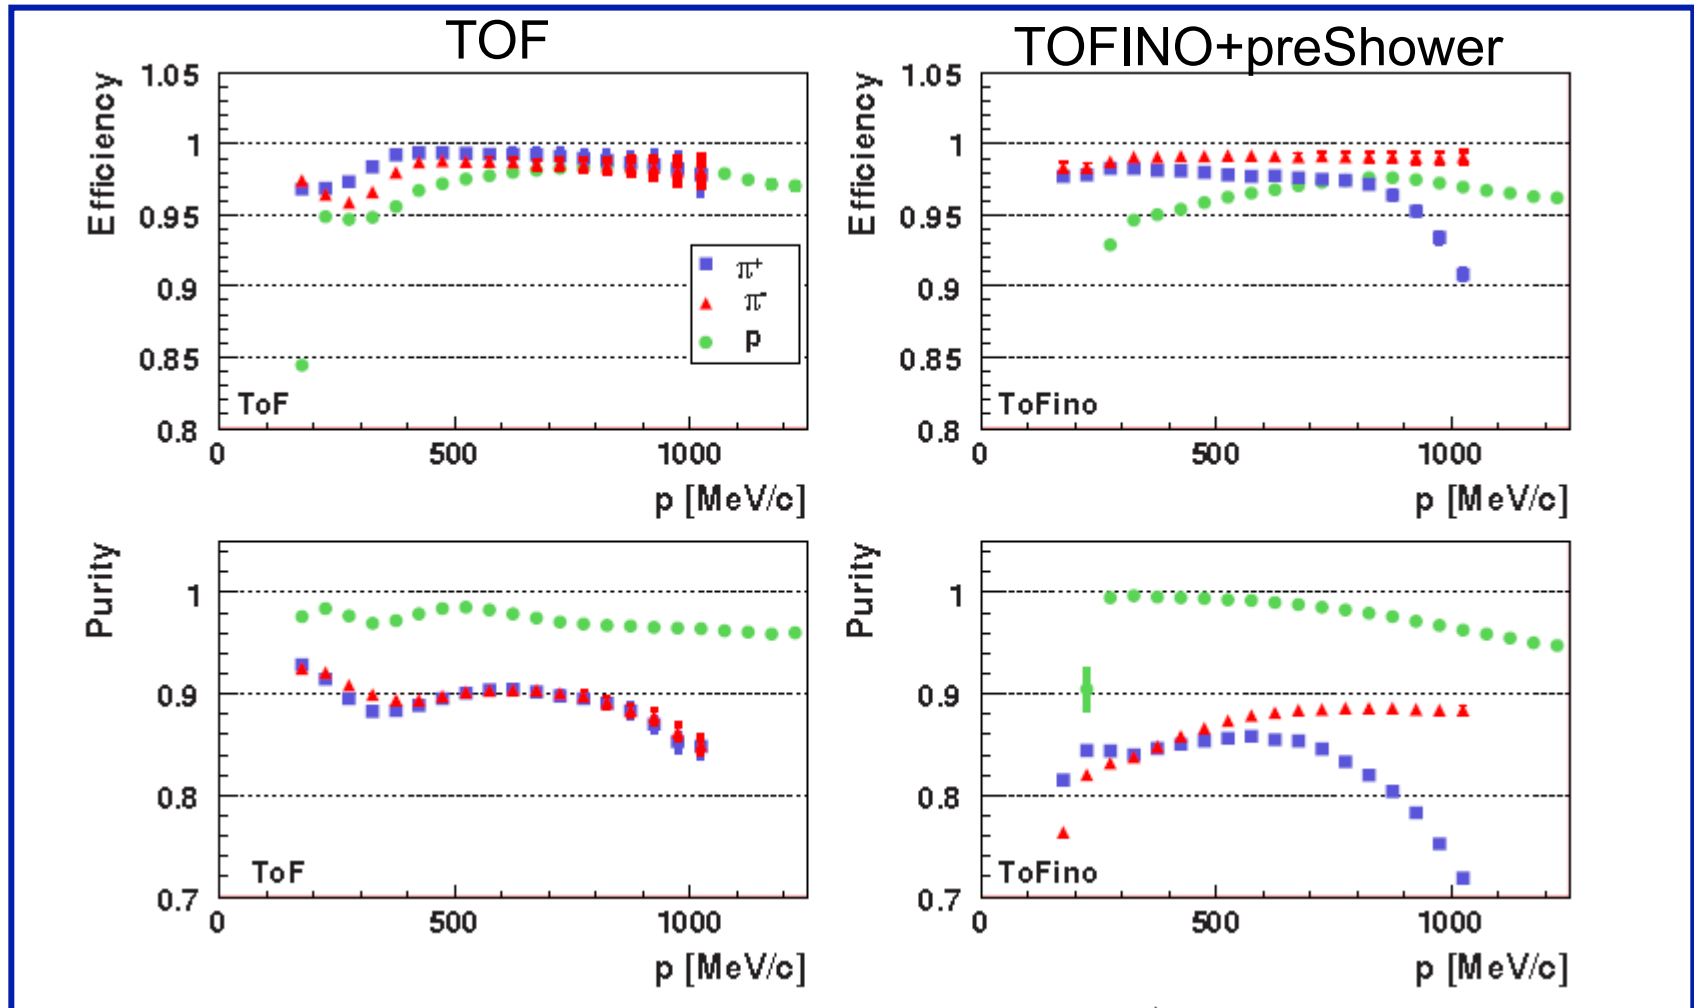

Things to do: Algorithms

- Evaluate efficiency and purity for each algorithm (standard macro)
- Evaluate performances by combining different algorithms (global PID)
- Global MVA analysis
- Influence of Geant3/Geant4
- ...

Things to do: Algorithms

- Forward PID under development
- EMC MVA method for π^0 identification?
- MDT Muon identification with MVA
- MDT neutral particle identification?
- Use PID for analysis!!!!
- ...

How to validate: Efficiency and Purity

HADES: EPJA40(2009)45

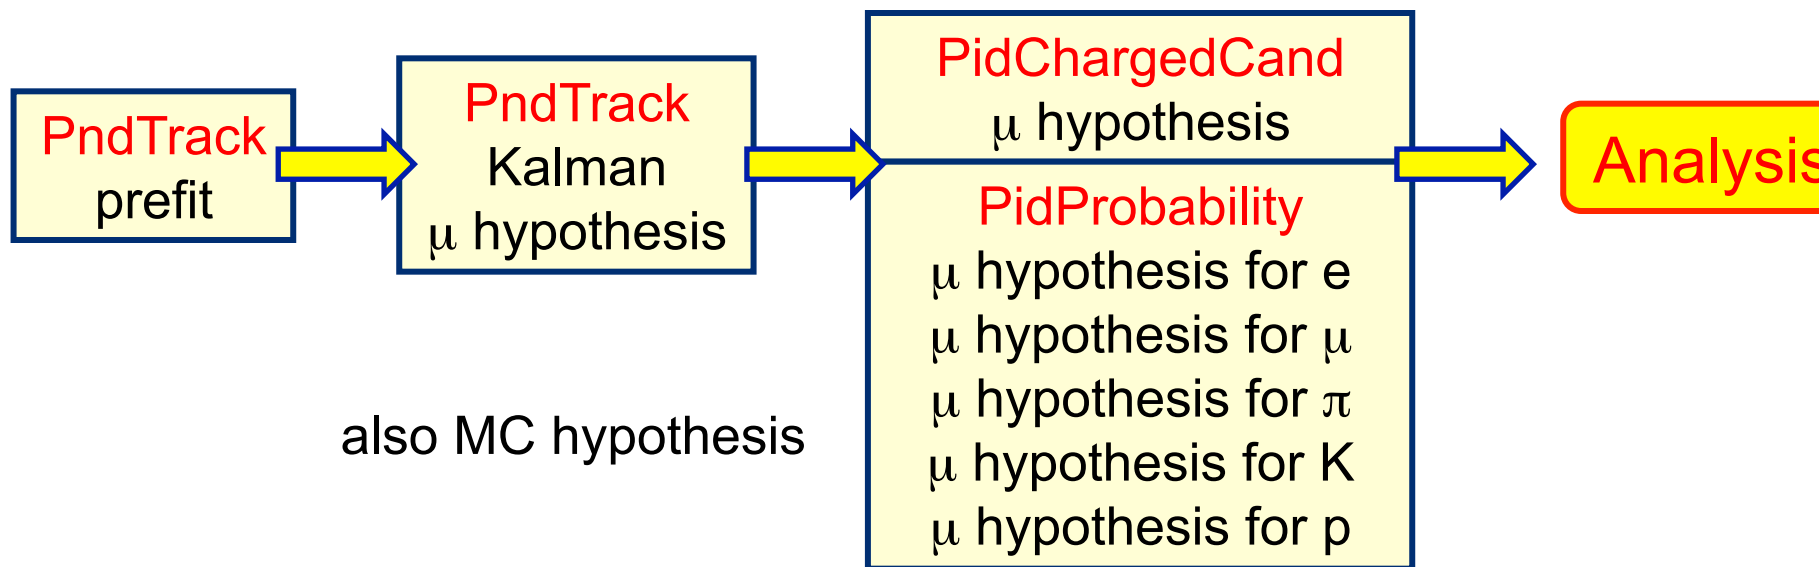

Multi-Hypothesis Particle Fit

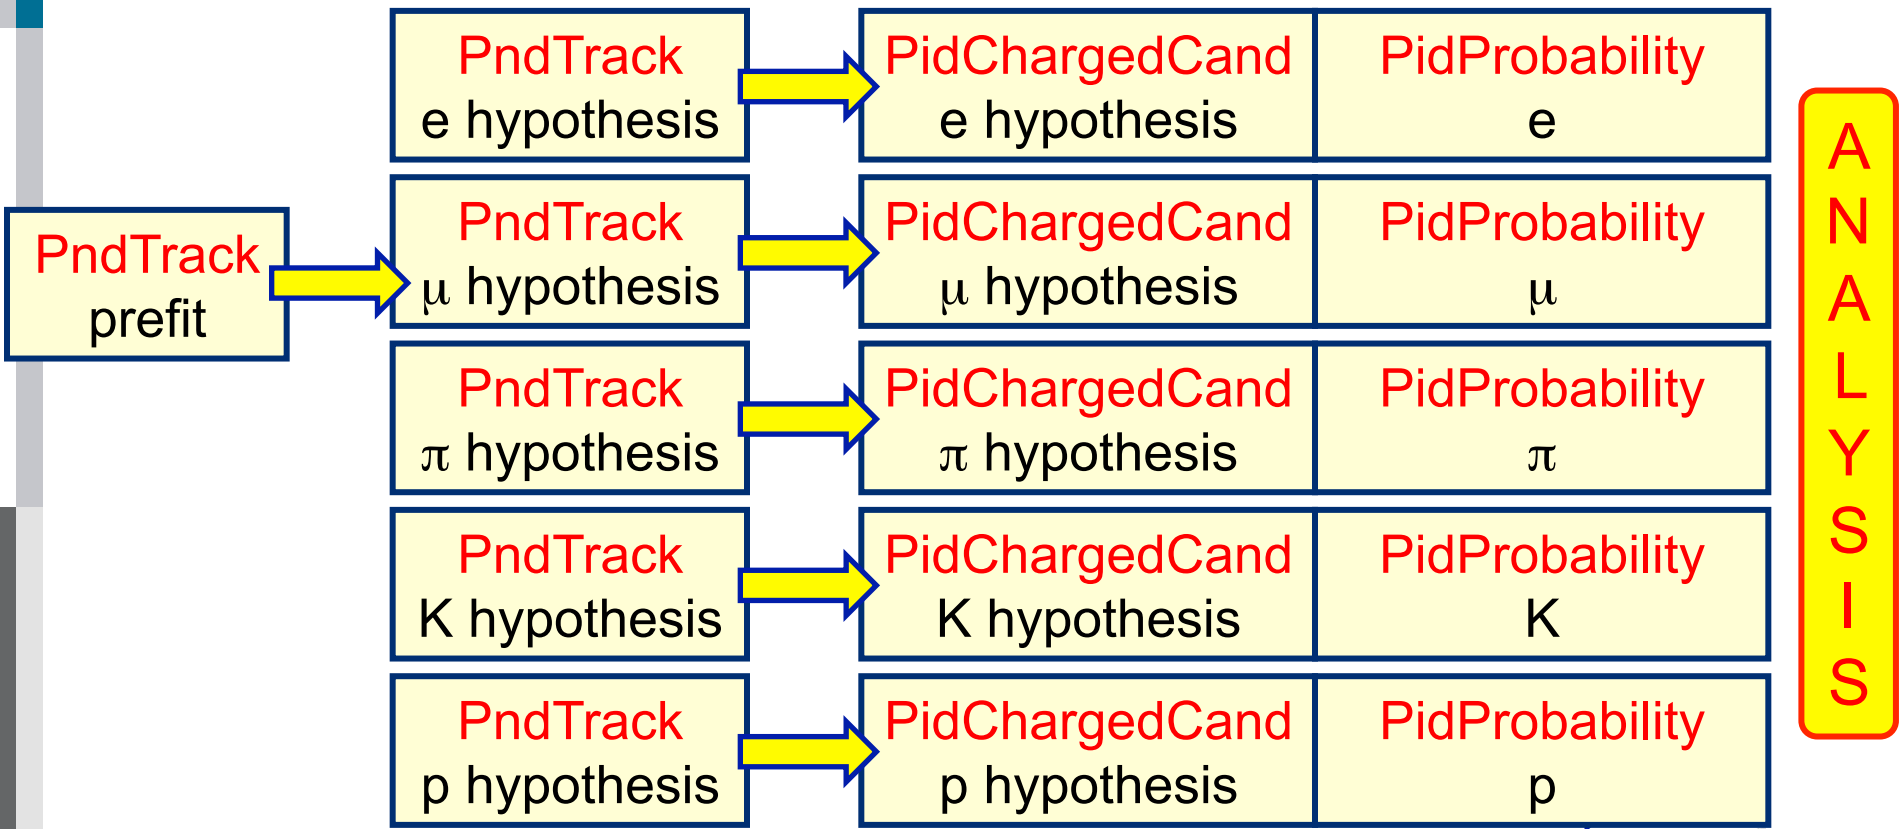

Things to do: Design and interface to analysis

Current Design

Things to do: Design and interface to analysis

New Design ?
