

# Mesons in the medium- what we have learned?

Mariana Nanova

II. Physikalisches  
Institut

## Outline:

- ◆ introduction: meson-nucleus interactions
- ◆ methods for determining meson-nucleus potentials
- ◆ potential parameters for  $K^+$ ,  $K^0$ ,  $K^-$ ,  $\eta'$ ,  $\omega$ ,  $\Phi$  - A interaction
- ◆ search for meson-nucleus bound states
- ◆ summary & outlook

\*funded by the DFG within SFB/TR16

International Conference on Exotic Atoms  
and Related Topics - EXA 2017  
Vienna, Austria, September 10-15, 2017

# meson-nucleus interaction

- 1.) interaction attractive or repulsive ??
- 2.) if attractive, interaction strong enough to form meson-nucleus bound state exclusively bound by the strong interaction??

exotic nuclear configurations:

nuclear physics: states with excitation energies of several 100 MeV

hadron physics: investigate in-medium static properties of mesons

mesons investigated:  $K^+$ ,  $K^0$ ,  $K^-$ ,  $\eta'$ ,  $\omega$ ,  $\Phi$

# meson-nucleus potential

H. Nagahiro, S. Hirenzaki, PRL 94 (2005) 232503

$$U(r) = V(r) + iW(r)$$

attractive ?  
repulsive ?

absorption

$$V(r) = \Delta m(\rho_0) \cdot \rho(r)/\rho_0$$

$$W(r) = -\Gamma_0/2 \cdot \rho(r)/\rho_0 \\ = -1/2 \cdot \hbar c \cdot \rho(r) \cdot \sigma_{inel} \cdot \beta$$

- line shape analysis
- excitation function
- momentum distribution
- meson-nucleus bound states

- transparency ratio measurement

$$T_A = \frac{\sigma_{\gamma A \rightarrow \eta' X}}{A \cdot \sigma_{\gamma N \rightarrow \eta' X}}$$

D. Cabrera et al., NPA733 (2004) 130

# determining the real part of the $\eta'$ -nucleus potential: comparison with collision/transport model calculations

E.Ya. Paryev, J. Phys.G 40 (2013)025201

- excitation function

in case of dropping mass -  
higher meson yield for given  $\sqrt{s}$   
because of increased phase space  
due to lowering of the production threshold

- momentum distribution of the meson:  
repulsion  $\Rightarrow$  higher  $\eta'$  kinetic energy

large attraction  $\Rightarrow$  low  $\eta'$  kinetic energy

$\Rightarrow$  downward shift of momentum distribution

$\Rightarrow$  enhancement  
at low energies

for in-medium mass drop:  $V(\rho=\rho_0) = -\Delta m(\rho=\rho_0)$

# determining the imaginary part of the meson-nucleus potential from transparency ratio measurements

$$T_A = \frac{\sigma_{\gamma A \rightarrow \eta' X}}{A \cdot \sigma_{\gamma N \rightarrow \eta' X}}$$

transport model calculation: GiBUU

P. Mühlich and U. Mosel, NPA 773 (2006) 156

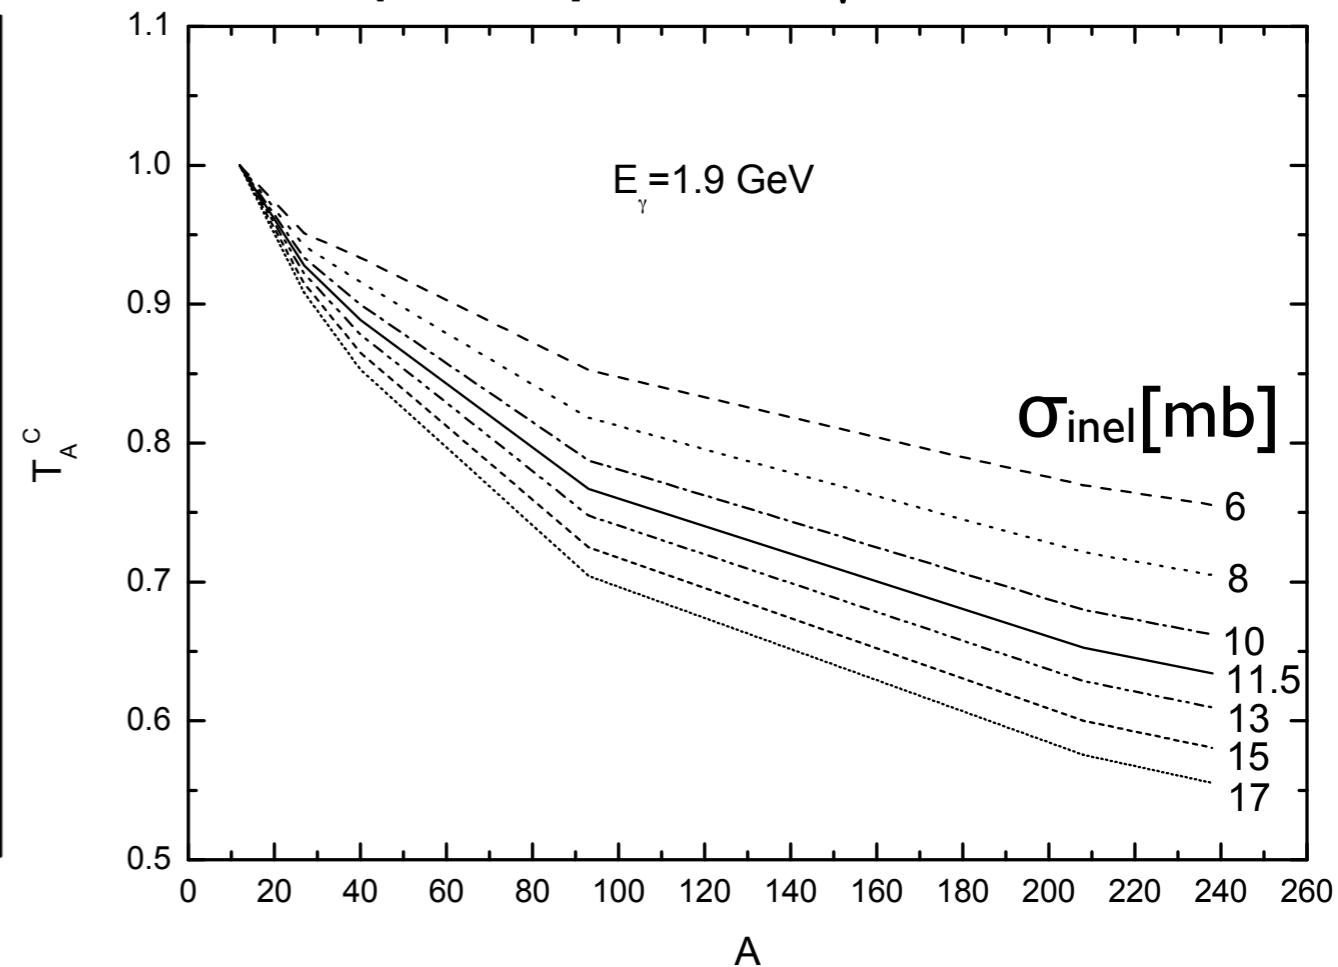

$\gamma A \rightarrow \omega X$  at  $E_\gamma = 1.5$  GeV

collision model calculation

E. Ya. Paryev, J. Phys.G 40 (2013)025201

$\gamma A \rightarrow \eta' X$  at  $E_\gamma = 1.9$  GeV

$$W(\rho = \rho_0) = -\Gamma/2 (\rho = \rho_0) = -1/2 \cdot \hbar c \cdot \rho_0 \cdot \sigma_{inel} \cdot \beta$$

# strategy for determining potential parameters

## real part of meson-nucleus potential

- measure meson excitation functions and/or momentum distributions
- compare with transport and/or collision model calculations for different sets of  $V_0$

$$\rightarrow V_0 = V(\rho=\rho_0)$$

## imaginary part of meson-nucleus potential

- measure transparency ratio  $T_A(A,p)$
- compare with transport and/or collision model calculations for different sets of  $\Gamma_{\text{med}}, \sigma_{\text{inel}}$

$$\rightarrow \Gamma_{\text{med}}, \sigma_{\text{inel}} \rightarrow W_0 = W(\rho=\rho_0; p=0)$$

$$U(\rho=\rho_0) = V_0 + iW_0$$

# excitation function and momentum distribution for $\eta'$ photoproduction off C

CB/TAPS @ ELSA

data: M. Nanova et al., PLB 727 (2013) 417

$\gamma C \rightarrow \eta' X$

calc.: E. Paryev, J. Phys. G 40 (2013) 025201

$$V_{\eta'}(\rho=\rho_0) = -(40 \pm 6) \text{ MeV}$$

$$V_{\eta'}(\langle p_{\eta'} \rangle \approx 1.1 \text{ GeV}/c; \rho=\rho_0) = -(32 \pm 11) \text{ MeV}$$

data disfavour strong mass shifts

# excitation function and momentum distribution for $\eta'$ photoproduction off Nb

CB/TAPS @ ELSA

data: M. Nanova et al., PRC 94 (2016) 025205

$\gamma \text{ Nb} \rightarrow \eta' X$

$$V_{\eta'}(\rho=\rho_0) = -(40 \pm 12) \text{ MeV}$$

$$V_{\eta'}(\langle p_{\eta'} \rangle \approx 1.1 \text{ GeV}/\text{c}; \rho=\rho_0) = -(45 \pm 20) \text{ MeV}$$

data disfavour strong mass shifts

# determining the real part of the $\eta'$ -nucleus potential

M. Nanova et al., PRC 94 (2016) 025205

$$V_0 = \Delta m(\rho = \rho_0) = -[39 \pm 7(\text{stat}) \pm 15(\text{syst})] \text{ MeV}$$

observed mass shift in agreement with QMC model predictions

S. Bass and T. Thomas, PLB 634 (2006) 368

# determining the real part of the $\omega$ -nucleus potential

M. N. and V. Metag, EPJ Web of conf. 130 (2016) 02007

$$V_0 = \Delta m(\rho = \rho_0) = -[29 \pm 19(\text{stat}) \pm 20(\text{syst})] \text{ MeV}$$

# determining the imaginary part of the $\eta'$ -nucleus potential

mass dependence of  $T_A$

M. Nanova et al., PLB 710 (2012) 600

$\Gamma_{\eta'}(\rho=\rho_0) = 15\text{-}25 \text{ MeV}$

$$T_A = \frac{\sigma_{\gamma A \rightarrow \eta' X}}{A \cdot \sigma_{\gamma N \rightarrow \eta' X}}$$

momentum dependence of  $\Gamma_0, W_0$

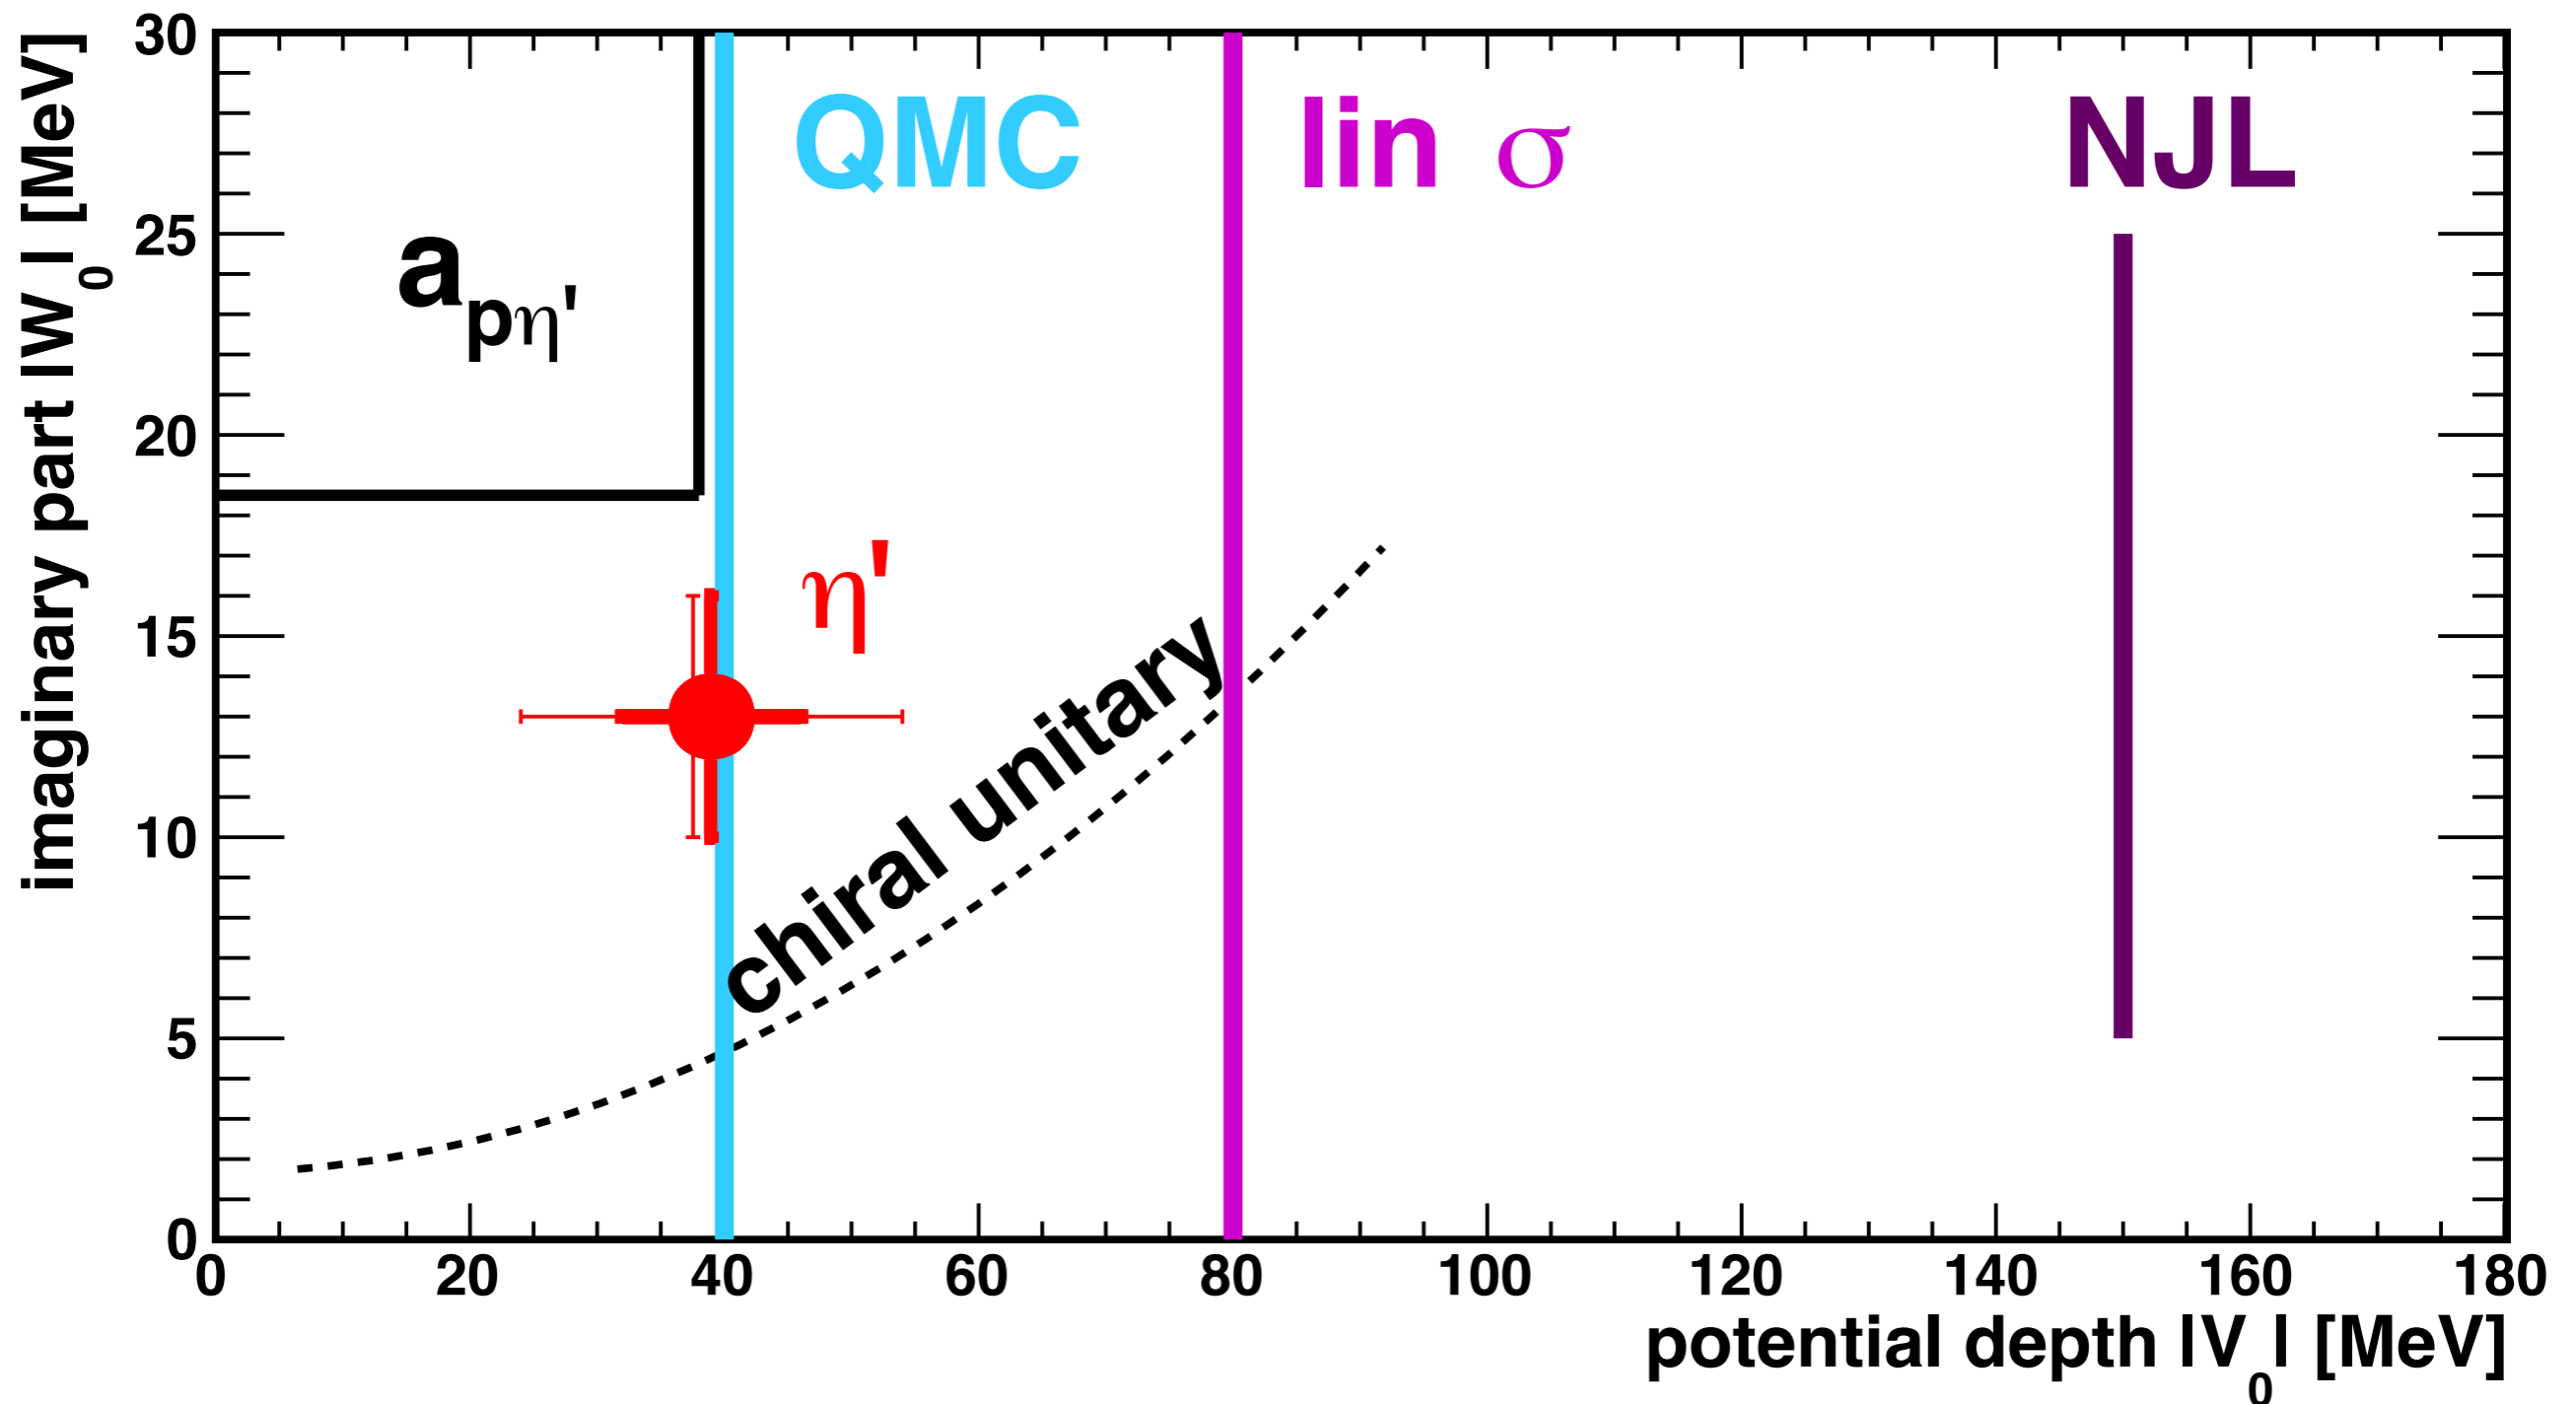

S. Friedrich et al., EPJA 52 (2016) 297

$$W_0 = \text{Im } U(\rho=\rho_0, p_{\eta'}=0) = -[13 \pm 3(\text{stat}) \pm 3(\text{syst})] \text{ MeV}$$

# summary of information on the $\eta'$ -nucleus potential

V. Metag, M. N. , E. Paryev , arXiv: 1706.09654, PPNP in press

$a_{p\eta'}$  - potential parameters corresponding to the  $p\eta'$  scattering length  
(Czerwinski et al. PRL 113 (2014) 062004 )

# determining the real part of the $K^0$ -nucleus potential

HADES: Ar + KCl at 1.756 AGeV  
 G.Agakishiev et al., PRC90 (2014) 054906

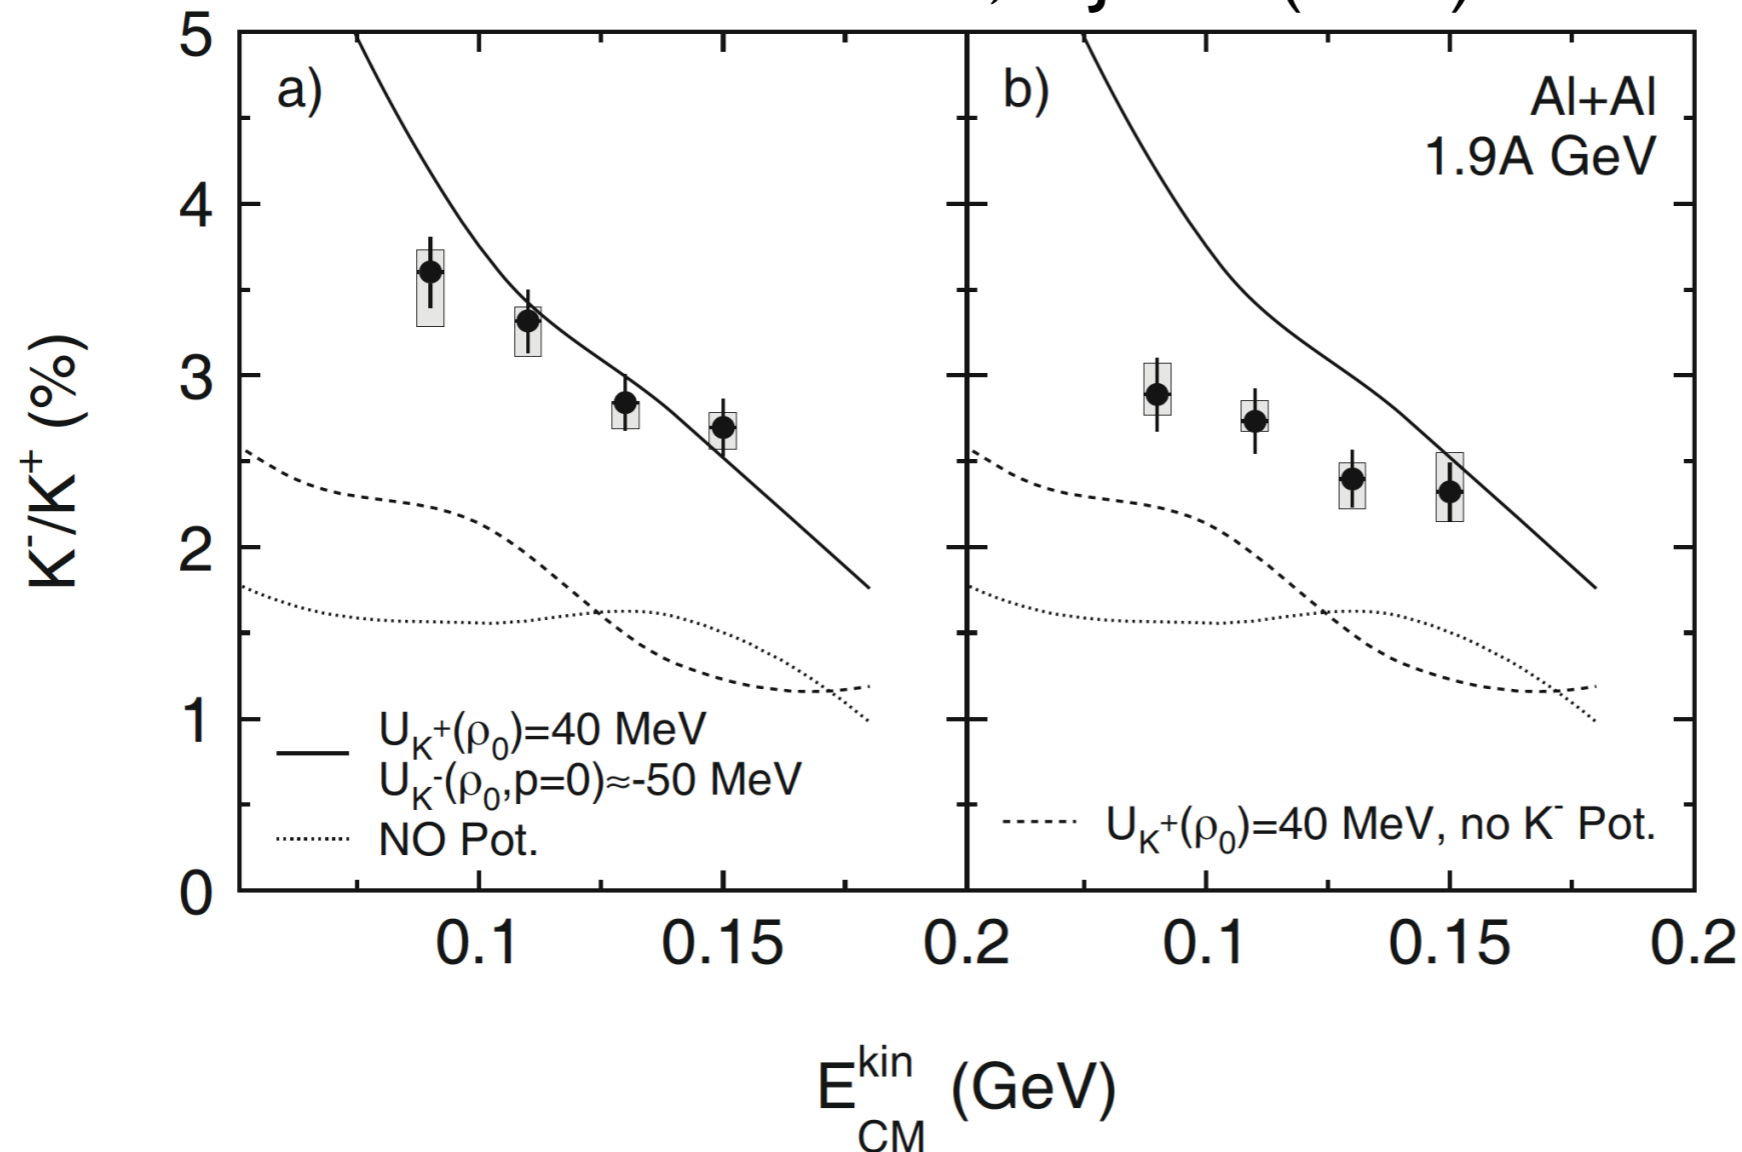

$K^0$  transverse momentum spectra  
 compared to IQMD transport calculations  
 without potential (dashed)  
 and with repulsive potential  
 of +46 MeV (solid curve)

$$V \approx +40 \text{ MeV}$$

# determining the real part of the $K^-$ -nucleus potential

$K^+$  and  $K^-$  kinetic energy spectra from Al + Al at 1.94 AGeV

FOPI: P. Gasik et al., EPJA 52 (2016) 177

$$V_{K^+} \approx +40 \text{ MeV}$$

$$V_{K^-} \approx -50 \text{ MeV} ??$$

b.) corrected for feeding of  $K^-$  spectrum from decay  $\Phi \rightarrow K^+K^-$  decays

$\Phi/K^-$ -ratio =  $0.36 \pm 0.05$  Ni+Ni at 1.9 AGeV (FOPI)

$\Phi/K^-$ -ratio =  $0.52 \pm 0.16$  Au + Au at 1.23 AGeV (HADES)

} not reproduced in transport calculations

# summary of information on the $\eta'$ -nucleus potential

Y. Tanaka et al., PRL 117 (2016) 202501

semi-exclusive experiment in preparation

$\Rightarrow$  increased sensitivity by studying formation AND decay of  $\eta'$ -mesic states

# summary and conclusions

- meson-nucleus interaction described by complex potential

$$U(r) = V(r) + iW(r)$$

- real part of meson-nucleus potential deduced from comparison of measured **meson excitation functions or momentum distributions** with transport and/or collision model calculations
- imaginary part of meson-nucleus potential deduced from comparison of measured **transparency ratios** with transport and/or collision model calculations
- measured potential parameters indicate favourable conditions ( $|V_0| \gg |W_0|$ ) for observing meson-nucleus quasi-bound states  
promising candidates:  **$K^-$ ,  $\eta$ ,  $\eta'$**   
 **$K^-pp$  clusters;  $\eta' \otimes {}^{11}\text{C}$  mesic nuclei**
- extension to charm sector difficult because of high momentum transfer

V. Metag, M. N., E. Paryev, arXiv: 1706.09654, PPNP in press

**Thank you!**

**back-up slides**

# excitation function and momentum distribution for $\omega$ photoproduction off C, Nb

V. Metag et al., PPNP67 (2012)530

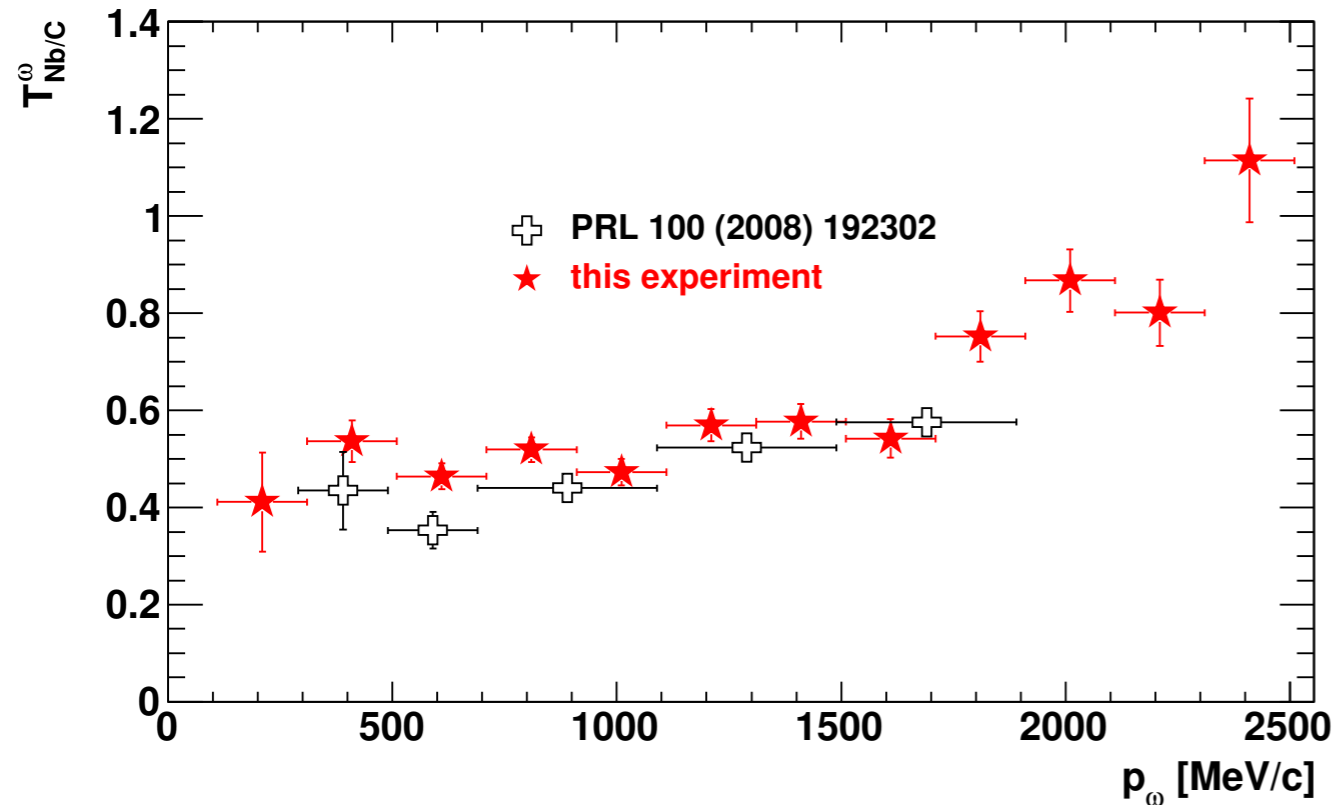

M. Thiel et al., EPJA 49 (2013) 132

$$V_0 = -[42 \pm 17(\text{stat}) \pm 20(\text{syst})] \text{ MeV}$$

# momentum dependence of $\omega$ transparency ratio: Nb/C

S. Friedrich et al., EPJA 52 (2016) 297

$$W(\rho=\rho_0) = -[48 \pm 12(\text{stat}) \pm 9(\text{syst})] \text{ MeV}$$

# Determining the real part of the $\omega$ -nucleus potential: GiBUU transport model simulations

J.Weil, U.Mosel and V.Metag, PLB 723 (2013) 120  $\omega \rightarrow \pi^0 \gamma$   
sensitive to nuclear density at production point

- [measurement of the excitation function of the meson](#)

in case of dropping mass -  
higher meson yield for given  $\sqrt{s}$   
because of increased phase space  
due to lowering of the production threshold

⇒ cross section enhancement

$\pi^0 \gamma$  excitation function

# Determining the real part of the $\omega$ -nucleus potential: GiBUU transport model simulations

J.Weil, U.Mosel and V.Metag, PLB 723 (2013) 120  $\omega \rightarrow \pi^0 \gamma$

sensitive to nuclear density at production point

- measurement of the excitation function of the meson

in case of dropping mass -  
higher meson yield for given  $\sqrt{s}$   
because of increased phase space  
due to lowering of the production threshold

⇒ cross section enhancement

- momentum distribution of the meson:

in case of dropping mass - when leaving the nucleus hadron has to become on-shell;  
mass generated at the expense of kinetic energy

⇒ downward shift of momentum distribution

$\pi^0 \gamma$  excitation function

$\pi^0 \gamma$  momentum distribution

# line shape Analysis: $\Phi$ meson

$p + C, Cu \rightarrow \Phi + X$  at 12 GeV

KEK E325: R. Muto et al., PRL 98 (2007) 042501

deviation from expected lines shape for slow ( $\beta\gamma < 1.25$ )  $\Phi$  mesons

$$V_0 = \Delta m(\rho=\rho_0) = -35 \pm 7 \text{ MeV}; \quad W(\rho=\rho_0) = -7^{+4}_{-3} \text{ MeV}$$

# line shape analysis??

determine mass from in-medium decay:

e.g.,  $\eta' \rightarrow \gamma\gamma$

$$m = \sqrt{(p_1 + p_2)^2}$$

probability for decay:

$$\frac{dP_{\text{decay}}}{dl} = \frac{mc}{p} \cdot \frac{l}{\hbar c} \cdot \Gamma_{\text{decay}} = 2.1 \cdot 10^{-5} / \text{fm}$$

$$\Gamma_{\eta' \rightarrow \gamma\gamma} = 4.1 \cdot 10^{-2} \text{ MeV}$$

probability for absorption:

$$\frac{dP_{\text{abs}}}{dl} = \sigma_{\text{abs}} \cdot \rho(r) = 0.21 / \text{fm} \text{ at } \rho = \rho_0$$

$$\sigma_{\text{abs}} = 13 \text{ mb}$$

$$\frac{P_{\text{decay}}}{P_{\text{abs}}} = 10^{-4} \text{ at } \rho = \rho_0$$

10 000 times more likely to get absorbed than to decay

more favourable decay/absorption ratio only at lower densities near the surface where in-medium modifications are reduced

sensitive to nuclear density at decay point

# real and imaginary part of the $\eta$ -nucleus potential
