

## Some recent developments in QCD spectroscopy

*Friday, 15 September 2017 12:00 (30 minutes)*

Important developments have recently taken place in the spectroscopy of light quark mesons and baryons in measurements made at the CESER electron-positron collider, and at the new GlueX photon facility at the electron accelerator at the Jefferson Laboratory. These include first measurements of the production of lambda, sigma, cascade and omega hyperons and their electromagnetic form factors, and photo production of J/psi and new light quark mesons at GlueX. A review of these and other developments in QCD spectroscopy will be presented, and future prospects discussed.
