

# Forward and Endcap EMC

M. Kavatsyuk  
for the PANDA Collaboration

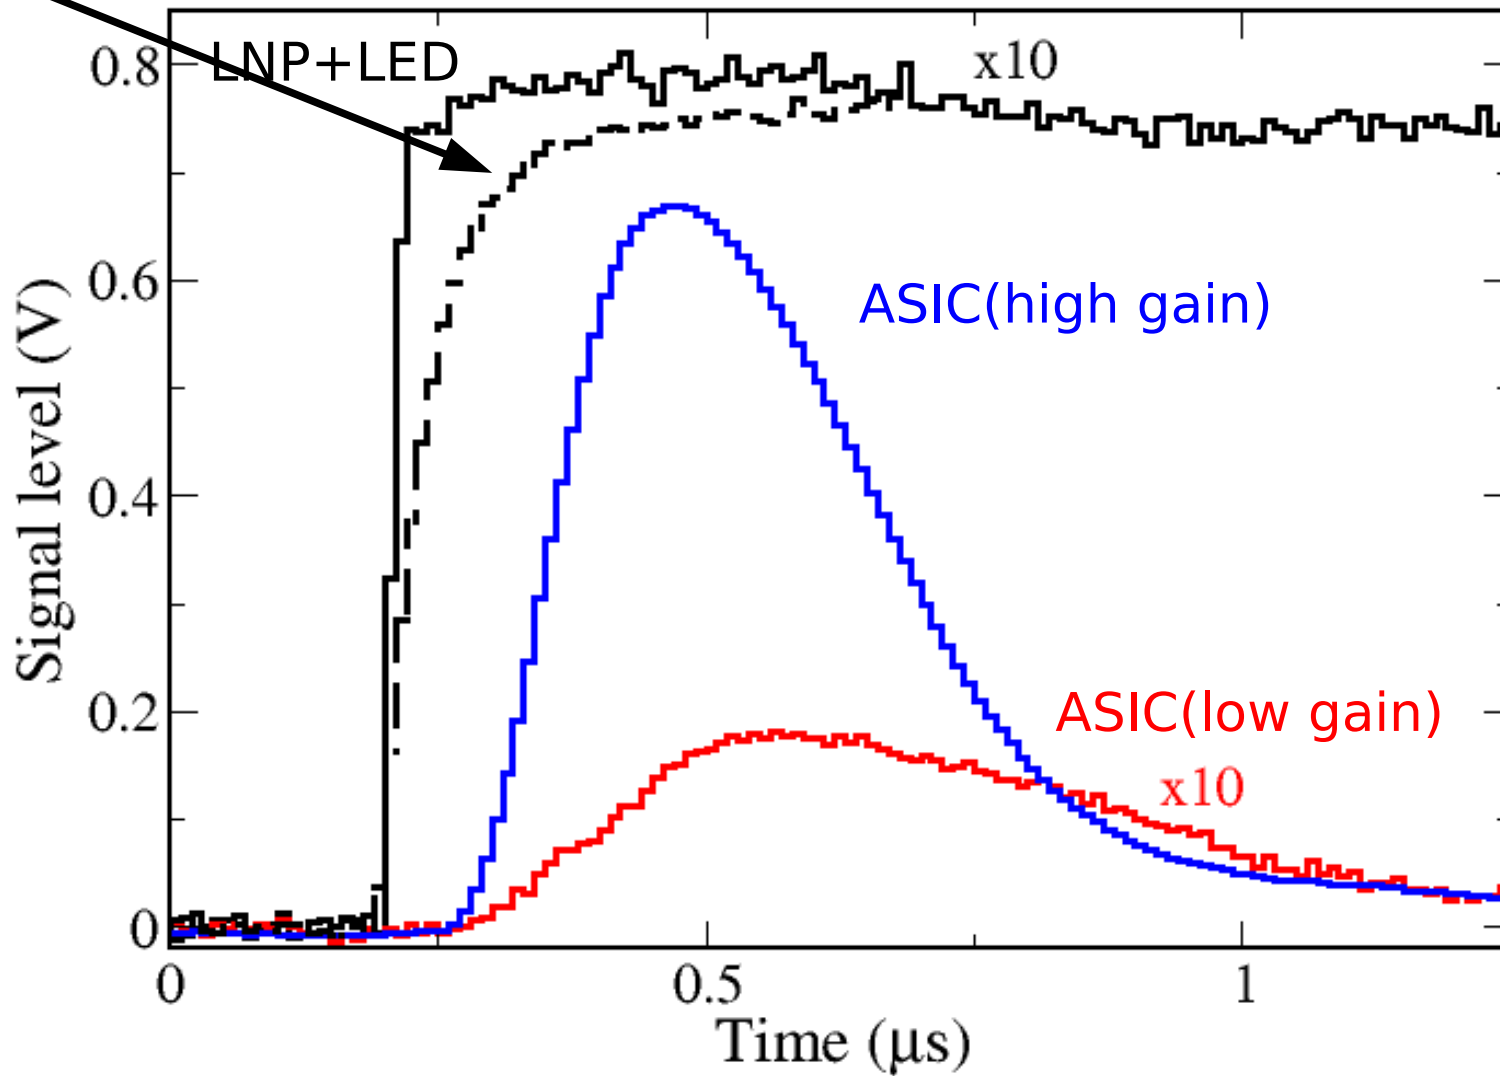

- ~15000  $\text{PbWO}_4$  crystals operated at  $-25^\circ\text{C}$
- Photo detectors:
  - Large Area Avalanche Photodiodes (2 per crystal; Barrel EMC; outer part of Endcap EMC?)
  - Vacuum Photo Triodes (Endcap EMC)
- Preamplifiers:
  - ASIC APFEL (preamp.+shaper; 2 channels; 2 gains outputs per ch; designed for LAAPD; developed at GSI)
  - Discrete LNP (designed for LAAPD and VPT developed at Basel)
- Prototypes:
  - Barrel EMC in operation: 60 crystals; LAAPD; LNP
  - Endcap EMC in development: 192 crystals; VPT+LNP, LAAPD+ASIC and LAAPD+LNP

	Required performance value		
Common properties			
energy resolution $\sigma_E/E$	$\leq 1\% \oplus \frac{\leq 2\%}{\sqrt{E/\text{GeV}}}$		
energy threshold (photons) $E_{thres}$	10 MeV (20 MeV tolerable)		
energy threshold (single crystal) $E_{xtl}$	3 MeV		
rms noise (energy equiv.) $\sigma_{E,noise}$	1 MeV		
angular coverage $\% 4\pi$	99 %		
mean-time-between-failures $t_{mtbf}$ (for individual channel)	2000 y		
Subdetector specific properties	backward ( $\geq 140^\circ$ )	barrel ( $\geq 22^\circ$ )	forward ( $\geq 5^\circ$ )
energy range from $E_{thres}$ to	0.7 GeV	7.3 GeV	14.6 GeV
angular equivalent of crystal size $\theta$		$4^\circ$	$1^\circ$
spatial resolution $\sigma_\theta$	$0.5^\circ$	$0.3^\circ$	$0.1^\circ$
maximum signal load $f_\gamma$ ( $E_\gamma > E_{xtl}$ )		60 kHz	500 kHz
(p $\bar{p}$ -events) maximum signal load $f_\gamma$ ( $E_\gamma > E_{xtl}$ )		100 kHz	500 kHz
(all events) shaping time $t_s$		400 ns	100 ns
radiation hardness	0.15 Gy	7 Gy	125 Gy
(maximum annual dose p $\bar{p}$ -events)			
radiation hardness		10 Gy	125 Gy
(maximum annual dose from all events)			

LNP + cosmic rays

One time bin corresponds to 10ns

LNP + cosmic rays

ends to 10ns

## Time Resolution (LED)

LNP + cosmic rays

One time bin corresponds to 10ns

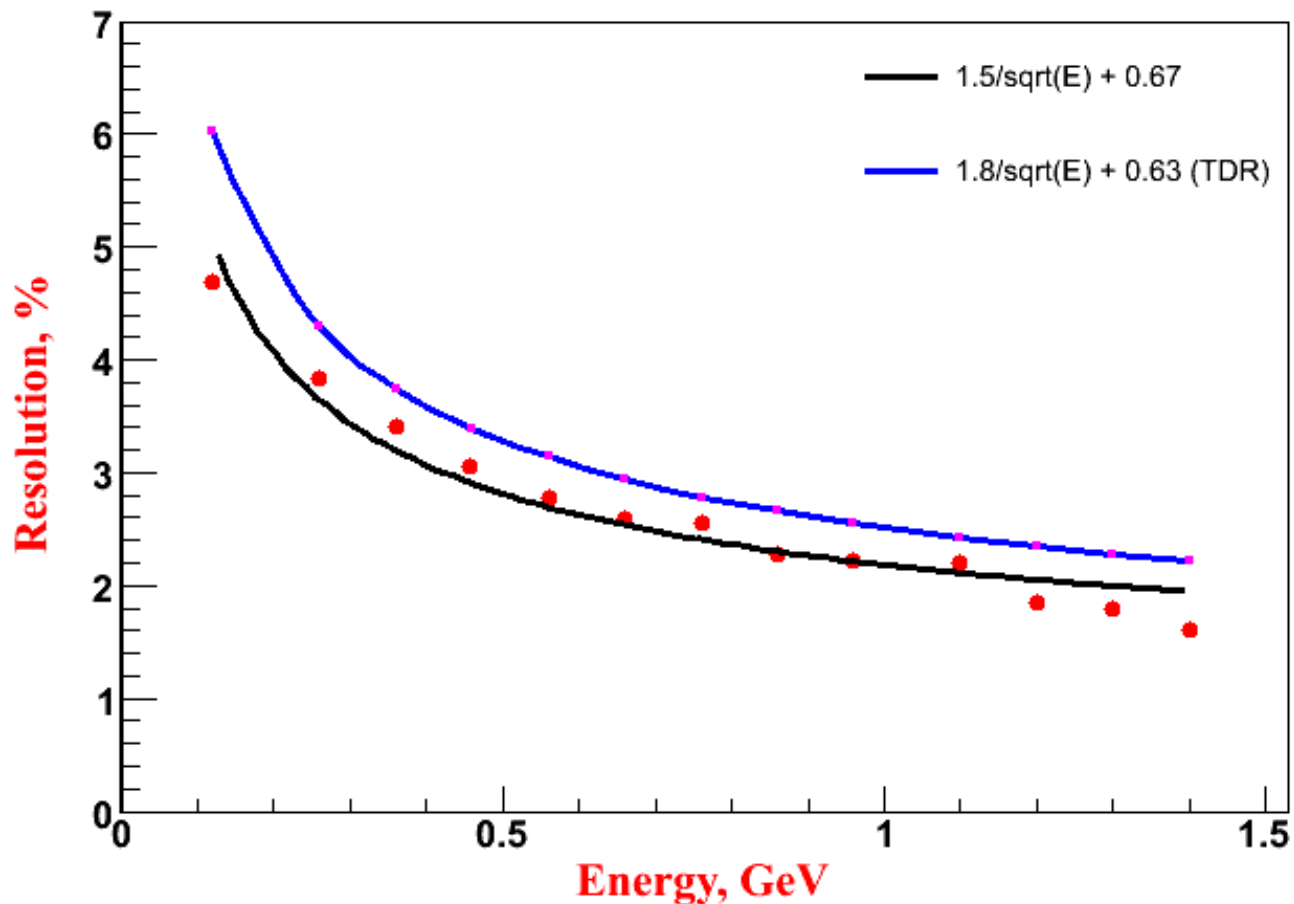

Same results are achieved with sampling rates of 50MHz and 25 MHz  
**but**  
results at 25MHz are too sensitive to chosen parameters

SADC readout compared with conventional QDC, advantages:

- no analogue delay lines
- possibility to cover total required dynamic range
- Digital filtering for noise reduction (**1.4 MeV  $\rightarrow$  0.3 MeV**)

Energy resolution:

**4,69 % @ 0.12 GeV**

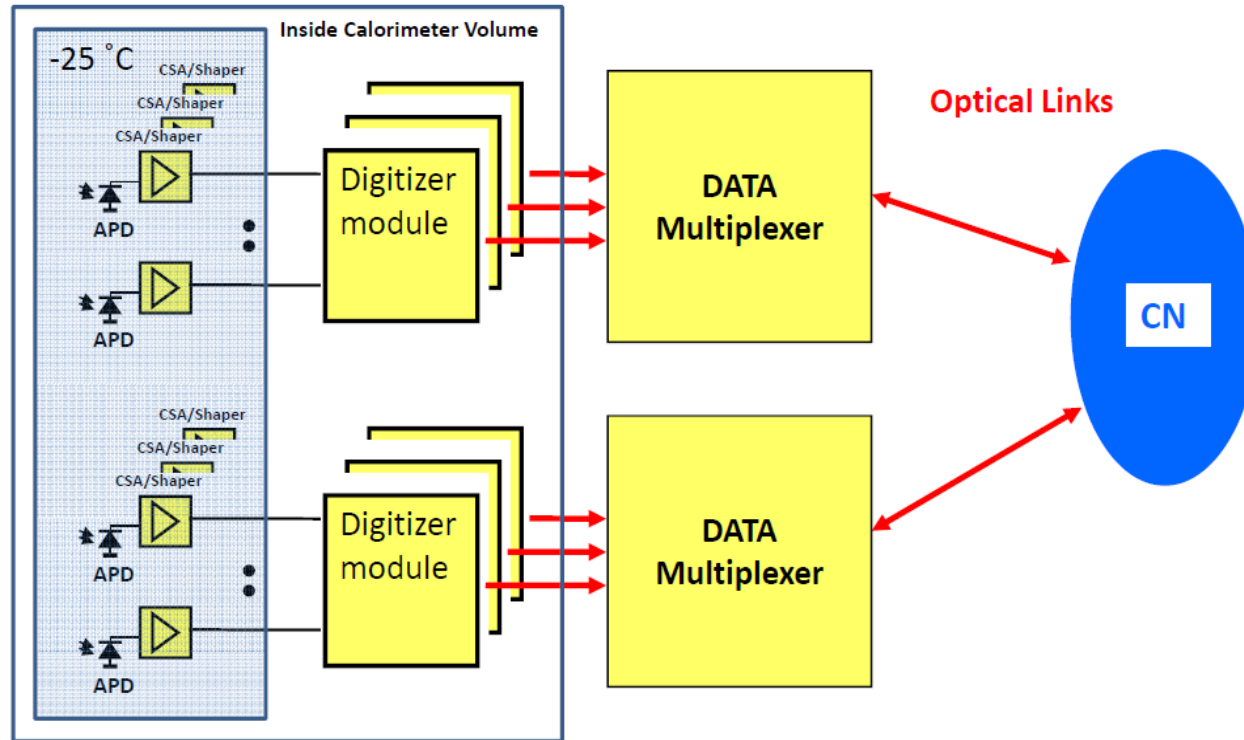

**2.20% @ 1.0 GeV**

**1.6 % @ 1.4 GeV**

Measurements with  
Proto60:

- 1 LAAPD per crystal
- LNP preamp.

- Role of Digitizers:
  - extract energy, time
- Role of Multiplexers:
  - find clusters
  - calculate Zernike moments

- EMC Prototypes (Proto 60 and Proto 192) allowed or will allow to test performance:
  - LAAPD+LNP was tested (fulfil TDR requirements)
  - LAAPD+ASIC
  - VPT+LNP
- Digitizer prototypes have to be designed
- Hardware implementation of Feature-extraction algorithms has to be tested
