

Hyperon Spectroscopy Status Report

Jun 8, 2017 | Albrecht Gillitzer, IKP Forschungszentrum Jülich

PANDA Collaboration Meeting 17/2, GSI Darmstadt, June 6-9, 2017

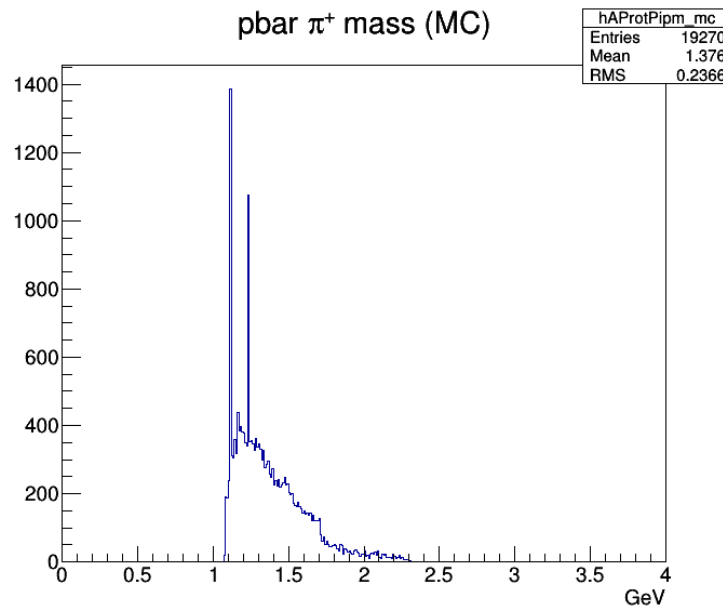

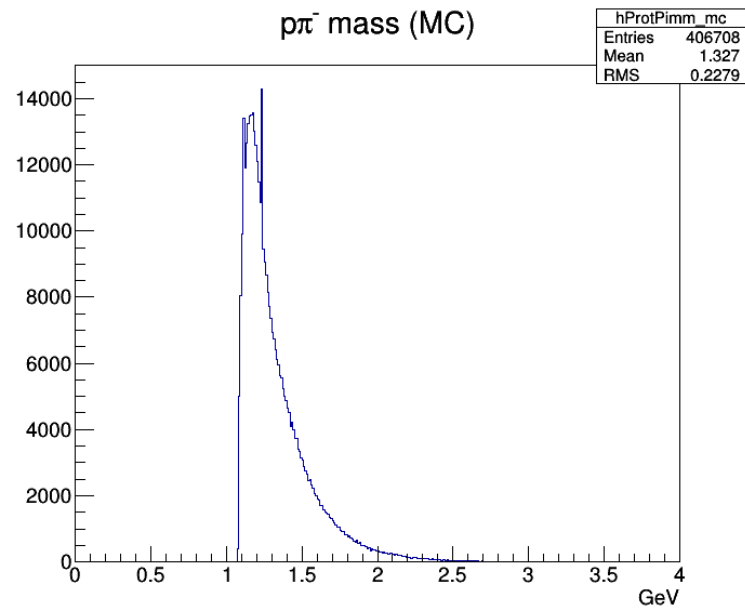

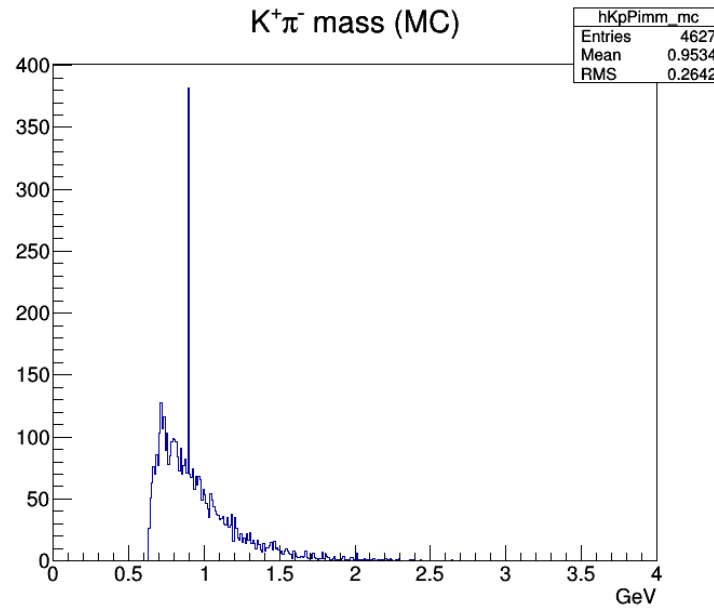

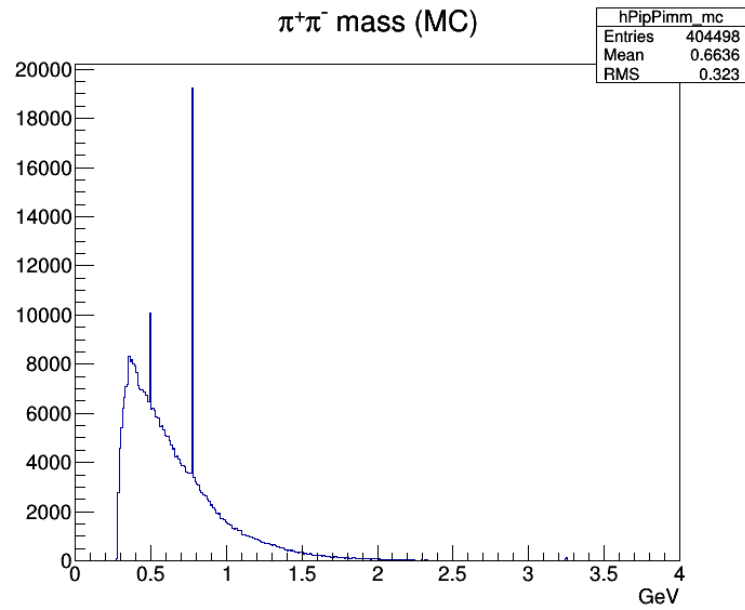

Items

- I. Production of zero-width resonances in FTF & G4
- II. Simulation & analysis of $\bar{p}p \rightarrow \Xi^- \bar{\Xi}^+ \pi^0$
- III. ‚Strange‘ decays / interactions seen in MC truth list

I: How to validate DPM & FTF simulation?

- Macros in .../macro/qa/dpm4 (and .../dpm3)
- Found that macros are useless since they attempt to reconstruct J/ψ and $\psi(2S)$
- Which are the appropriate criteria?
- Idea: try to reconstruct composite particles
 - 10^5 DPM events;
 - MC Truth primary & secondary particles
 - Combination of two particles coming from same vertex

DPM 4.6 GeV/c $\bar{p}p$ prim. & sec. MC truth 2-body masses

Direct Test of DPM and FTF Generator Output

- 1.0 M events
- 4.6 GeV/c
- Generator output
- Result:
 - DPM does not produce these zero-width states
 - FTF produces the zero-width resonances

Final test with Box Generator Events

- 0.1 M events
- 4.6 GeV/c \bar{p} , then later also 15 GeV/c p
- 1 \bar{p} per event \rightarrow all particles except one are secondary
- θ range: $5^\circ - 45^\circ$
- φ range: $0^\circ - 360^\circ$
- build 2-particle invariant mass spectra
- condition: common start point

II: Simulation of $\bar{p}p \rightarrow \Xi^- \bar{\Xi}^+ \pi^0$

- 4.6 GeV/c $\bar{p}p \rightarrow \Xi^- \bar{\Xi}^+ \pi^0$ (PHSP)
- $1 \cdot 10^6$ events simulated (trunk 29773)
- $\bar{\Xi}^+, \Xi^-$,stable' in EvtGen
- $\Lambda \rightarrow p\pi^-$ & $\bar{\Lambda} \rightarrow \bar{p}\pi^+$ ($\sim 40\%$) analyzed
- focus on reconstruction efficiency and momentum & position resolution
- charged and composite particles: MC truth matched (correct PID, correct mother)
- photons: include neutral candidates whose mother is a photon and whose grandmother is pbarpSystem

Event Statistics

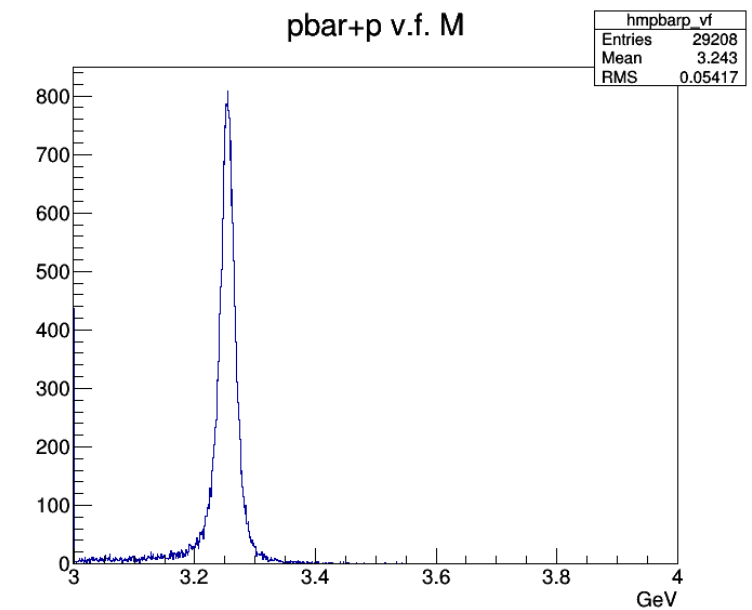

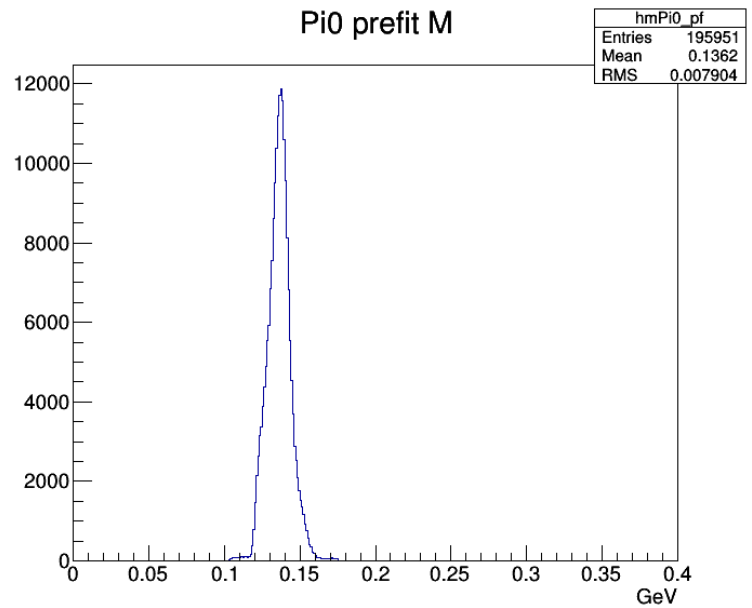

Reconstruction Efficiencies

reconstruction efficiencies in % :

p	\bar{p}	π^-	π^+	π^0	Λ	$\bar{\Lambda}$	Ξ^-	$\bar{\Xi}^+$	$\bar{p}p$
90.8	88.7	78.3	78.3	52.0	59.3	57.3	44.0	42.5	7.8

- note:
 - Ideal tracking, no condition on #hits yet
 - ideal PID
 - MC truth matching (correct mother)
- KinVtxFitter \rightarrow vertex, KinFitter \rightarrow M, 4CFitter \rightarrow initial p4
- composite particles: losses due to mass & probability cut

$\Xi^- \bar{\Xi}^+ \pi^0$ Dalitz Plot

- Here: still problem of entries at wrong masses *after* mass and 4C fits (meanwhile solved by Xinying)

III: ‚Strange‘ Decays / Interactions in MC Truth List

- Recent improvement:
option to select specific decay modes in Geant4 by using „UserDecayConfig“ file (Dominik Steinschaden)
 - Set $\Lambda \rightarrow p\pi^-$ & $\bar{\Lambda} \rightarrow \bar{p}\pi^+$ decay modes to 100%
 - $\Xi^- \rightarrow \Lambda\pi^-$ & $\bar{\Xi}^+ \rightarrow \bar{\Lambda}\pi^+$ is already $\sim 100\%$
 - Expect $\sim 100\%$ $\Lambda \rightarrow p\pi^-$ & $\bar{\Lambda} \rightarrow \bar{p}\pi^+$ final state
 - However: find only 92.4% in this final state
- What happened to the missing events?

Checking the MC Truth List

- Print all decays / interactions with deviations from selected pattern
 - # daughters, pid, \vec{X} , \vec{p}
- Found deviations:
 - all particle species: Ξ^- , $\bar{\Xi}^+$, Λ , $\bar{\Lambda}$
 - Most cases not explainable by interaction with material
 - number of daughters differs from 2: e.g. 1, 3, ... > 10
 - not all daughters have the same start vertex (???)
- Problem either in G4 or in filling of MC list, but further study required

N Ξ^- daughtersN anti- Ξ^+ daughtersN Λ daughtersN anti- Λ daughters

Event Scan: ‘Mysterious’ Cases

- $\bar{\Xi}^+ \rightarrow e^- \bar{\Lambda} \pi^+$ (many)
 - electron added to the decay final state
 - different start vertex, always upstream of other particles
 - analogous for Ξ^- , $\bar{\Lambda}$, Λ
- $\bar{\Xi}^+ \rightarrow \bar{\Lambda}$ (many)
 - one single daughter, missing pion
 - analogous for Ξ^- , $\bar{\Lambda}$, Λ
- $\Lambda \rightarrow \pi^- \gamma n$ (1); $\Lambda \rightarrow 3p 7n 2\gamma$ (1)
 - violate Q and S !
 - all daughters have same start vertex
- All others are explainable as interaction with material

Summary

- Zero-width resonances in G4 and FTF
- Preliminary analysis of $\bar{p}p \rightarrow \Xi^- \bar{\Xi}^+ \pi^0$ at 4.6 GeV/c
- Found cases in the MC particle list which are incompatible with ,decays‘ or ,interactions‘

Finding solutions is nicer than finding problems
but
Finding problems is still better than finding nothing !
