Thermal dilepton emission as a fireball probe

DGP spring meeting 2017

Florian Seck – TU Darmstadt

in collaboration with T. Galatyuk, R. Rapp & J. Stroth

Electromagnetic probes in heavy-ion collisions

CBM cocktail – invariant mass of dielectrons

TECHNISCHE UNIVERSITÄT DARMSTADT

Electromagnetic probes in heavy-ion collisions

Insights from theory

integrated yield of thermal radiation in the mass range 0.3-0.7 GeV/c² is sensitive to the lifetime of the fireball

R. Rapp, H. van Hees: Phys. Lett. B 753 (2016) 586

- dilepton yield determined by interplay between temperature and fireball volume
- slope of dileptons in the intermediate-mass range constitutes a blue-shift free fireball thermometer
- What happens at low energies?

Realistic dilepton emission rates

8-differential thermal production rate

$$\frac{dN_{ll}}{d^4xd^4q} = -\frac{\alpha_{\rm EM}^2}{\pi^3 M^2} f^B(q \cdot u; T) \operatorname{Im}\Pi_{\rm EM}(M, q; \mu_B, T)$$

$$R = \frac{\sigma(e^+e^- \to \text{hadrons})}{\sigma(e^+e^- \to \mu^+\mu^-)} \propto \frac{\operatorname{Im}\Pi_{\rm EM}^{\rm vac}}{M^2} \approx \int_{0}^{10} \int_{0}^{10}$$

additional contributions to the ρ meson self-energy in the medium

Description of the fireball evolution

Coarse-graining of hadronic transport

- "combine" the advantages of both descriptions: hydrodynamics & transport
- simulate events with a transport model
 - ----> ensemble average to obtain smooth space-time distributions
- divide space-time evolution into 4-dimesional cells
 - 21 x 21 x 21 space cells (1fm³), 30 time steps \longrightarrow ~ 280 k cells
- determine for each cell the bulk properties like T, $\rho_B \& v_{coll}$
- calculate dilepton rates based on these inputs
 - → parameterization of RW in-medium spectral function
- sum up the contributions of all cells
- similar approaches by
 - Huovinen *et al.*: PRC **66** (2002) 014903
 - Endres et al.: PRC 91 (2015) 054911, PRC 92 (2015) 014911, PRC 93 (2016) 054901, PRC 94 (2016) 024912

- baryon density via 4-current
- Lorentz-boost into the local rest frame (LRF) where the baryon current vanishes
- in Boltzmann approximation

$$\frac{d^3N}{d\vec{p}} = \frac{d^3N}{dp_z \, p_t \, dp_t \, d\theta} \propto \exp(-E/T) \implies \frac{1}{m_t^{3/2}} \, \frac{dN}{dm_t} \propto \exp(-m_t/T).$$

- fill m_t spectra with particle momenta in LRF (mean flow v_{coll} vanishes)
- fit exponential function to extract T (species of choice: pions)

March 30, 2017 | DPG spring meeting 2017 - Münster | Florian Seck - TU Darmstadt | 7 / 14

Results

Au+Au at 1.23A GeV

- evolution of T, ρ_{eff} and μ_{π} in the central cube of 7x7x7 cells
- trajectories of the cells in the temperature-density plane

Dileptons as fireball probes

Au+Au at 1.23A GeV

- time evolution of cumulative dilepton yield in mass window M = 0.3-0.7 GeV/c²
- active radiation window ~13 fm/c follows build-up of collective medium flow is fireball lifetime
- ▶ strong medium effects on p-meson ⇒ remarkably structure-less low-mass spectrum > $dR_{ll}/dM \propto (MT)^{3/2} \exp(-M/T)$
- ▶ inverse slope parameter: T_s = 88 ± 5 MeV in IMR, T_s = 64 ± 5 MeV in LMR

Dileptons as fireball probes

Ar+KCl at 1.76A GeV (\sqrt{SNN} = 2.6 GeV)

- evolution of T, ρ_{eff} and μ_{π} in the inner cube of 5x5x5 cells
- T and μ_{π} [MeV] invariant mass spectrum for the thermal radiation
- window for dilepton radiation & build-up of collectivity ~ 8fm/c

Excitation function of dilepton production

Yield in low-mass window tracks fireball lifetime

fireball dominated by incoming nucleons at lower energies

- number of charged particles N_{ch} not a good proxy for thermal excitation energy
- normalization to number of charged pions N_{π}
- lifetime from dilepton yield in mass window 0.3-0.7 GeV/c²: $\frac{N_{l^+l^-}}{N_{\pi^{\pm}}} \cdot 10^6 \simeq 1.45 \cdot \tau_{\rm fb}$

TECHNISCHE UNIVERSITÄT DARMSTADT

Comparison to experimental excess spectra

Ar+KCl at 1.76A GeV & Au+Au at 1.23A GeV (min. bias)

Exploring the QCD phase diagram –

with dileptons

- chemical freeze-out from measured particle yields analyzed with SHM THERMUS 2.3
- trajectories extracted from inner cube of cells with coarse-grained UrQMD
- time-window of dilepton emission
 - radiation stops shortly after chemical freeze-out
 - access to hot and dense stage of the heavy-ion collision

TECHNISCHE UNIVERSITÄT DARMSTADT

Summary & Outlook

- dileptons are excellent fireball probes
 - thermometer & chronometer
 - new insights into the matter created under extreme conditions
- thermal dilepton spectra from highest to lowest energies
 - realistic thermal dilepton emission rates
 - accurate description of fireball evolution in terms of T, ρ_{eff} , v_{coll} and μ_{π}
 - coarse-graining of hadronic transport at SIS energies
- baseline for future explorations by HADES & CBM
 - > any significant deviation can indicate interesting physics!

Thank you for your attention !

Electromagnetic probes in heavy-ion collisions

Experiments across the QCD phase diagram

A NA60 (μ+μ-) : H.J.Specht: AIP Conf. Proc. 1322 (2010)

Search for

- phase boundary(ies)
 - \rightarrow fluctuations of conserved quantum numbers
 - → flavor production (multi-strange, charm)
- change in microscopic degrees of freedom
- restoration of chiral symmetry
- emitting source temperature
 - → electromagnetic probes leave collision zone undistorted
 - \rightarrow real γ characterized by transverse momentum
 - → dileptons carry extra information: invariant mass

Space-time evolution of a heavy-ion collision

Au+Au at 1.23 AGeV ($\sqrt{S_{NN}}$ = 2.4 GeV) \implies HADES energy regime

Local thermalization?

Momentum distributions of nucleons ($N_{coll} \ge 3$) & pion m_t spectra

- Gaussian shaped p_z distribution builds up for nucleons with $N_{coll} \ge 3$
- m_t spectra show exponential shape

March 30, 2017 | DPG spring meeting 2017 - Münster | Florian Seck - TU Darmstadt | 19 / 14

Out of chemical equilibrium?

Build-up of effective chemical potentials

- thermal emission rates assume chemical equilibrium
- chemical non-equilibrium possible, e.g. after chemical freeze-out
 - no more inelastic interactions -> pion number conserved
 - system in thermal equilibrium cools down further -> over-population of pions
 - build-up of an effective chemical potential μ_{π}
- induces a factor $(z_{\pi})^{\kappa}$ in the dilepton rates with the fugacity $z = \exp\left(\frac{\mu_{\pi}}{T}\right)$
 - exponent κ reflects the main production mechanism of ρ mesons
 - at HADES energies UrQMD suggests $\kappa = 1.12$

Dileptons as fireball probes

Interplay temperature – fireball volume

Pluto

A Monte Carlo simulation tool for hadronic physics

in simple terms: Pluto is a ROOT based "laptop"

framework for implementing customized event generators:

- object oriented (C++), modular, flexible
- fast simulations (kinematics, decay)
- filters (e.g. acceptance, efficiency)
- no transport through media, no geometry, no field

- original intention of developing Pluto:
 - \blacktriangleright feasibility studies \rightarrow fast event generation
- later:
 - model comparison, acceptance corrections

for more information: PoS ACAT2007 076

Realistic dilepton emission rates

Hadronic matter

R. Rapp, J. Wambach: Eur. Phys. J. A 6 (1999) 415

depends on

- temperature T
- effective baryon density ρ_{eff}

$$\varrho_{\rm eff} = \varrho_{\rm N} + \varrho_{\bar{\rm N}} + \frac{1}{2} \left(\varrho_{\rm R} + \varrho_{\bar{\rm R}} \right)$$

• pion chemical potential μ_{π}

reproduces excess in experimental data

- CERES
- NA60
- STAR (including BES)
- PHENIX with HBD
- at higher masses: include hadronic continuum radiation

E. V. Shuryak: Rev. Mod. Phys. 69 (1993) 1
