

Drell-Yan at Phase1: cross-sections and muon distributions

A.N.Skachkova
(JINR, Dubna)

PANDA Collaboration Meeting

**4-8 September 2017,
BINP, Novosibirsk**

Drell-Yan process was simulated with use of PYTHIA 6.4 with beam momentum set 3.5 – 15.5 GeV at the statistics of 100000 events.

Number of events/year is calculated in assumption of 150 days/year data taking (~5 months). Pictures are made for the case of HESRr accelerator mode with $R=10^7/s$ production rate.

Luminosities numbers were taken from the paper of Klaus Götzen
“Average Luminosities and Event Rates at PANDA” Oct. 2015
(IN-IDE-2015-002.pdf)

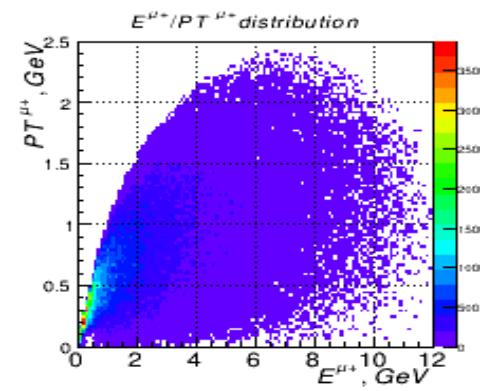

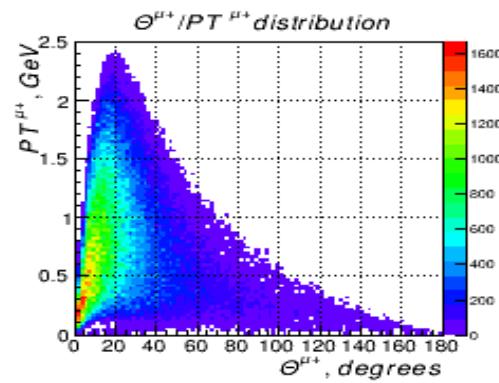

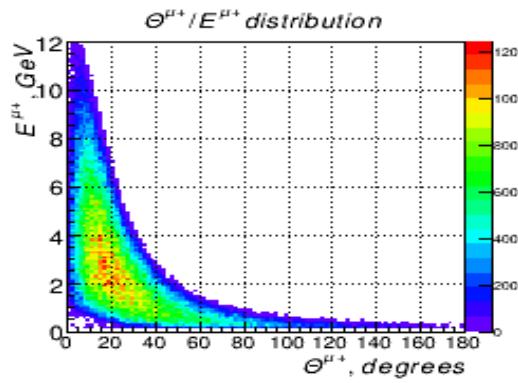

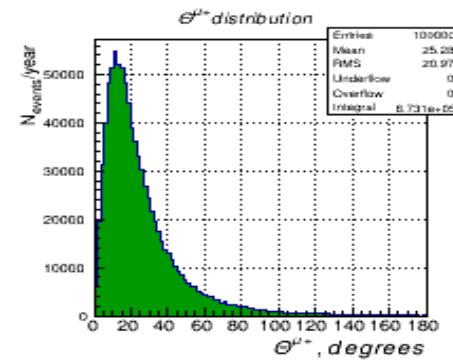

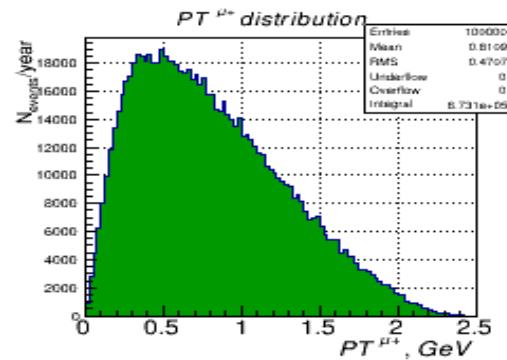

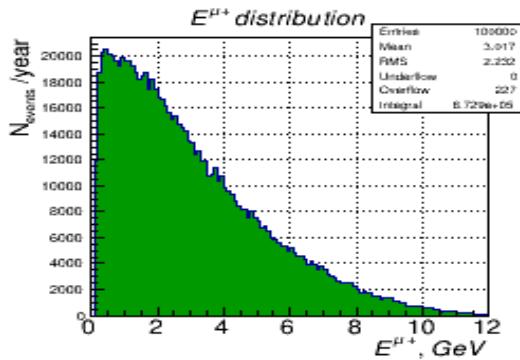

Drell-Yan cross-sections

p [GeV/c]	Ecm [GeV]	Cross-section [nb]	Luminosity [HESRr]	Nevents / year
3.5	2.93	5.93×10^{-4}	997	88
4.0	3.08	1.99×10^{-2}	1070	3150
