

Single-particle spectral function of the Λ -hyperon in finite nuclei

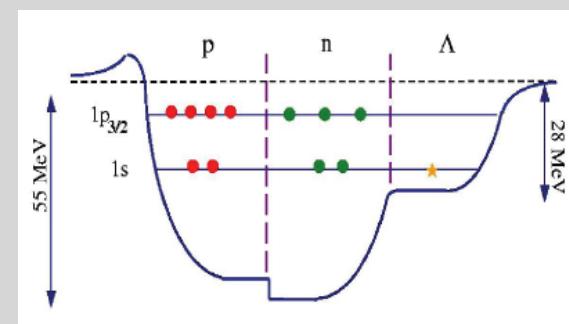

Isaac Vidaña, INFN Catania

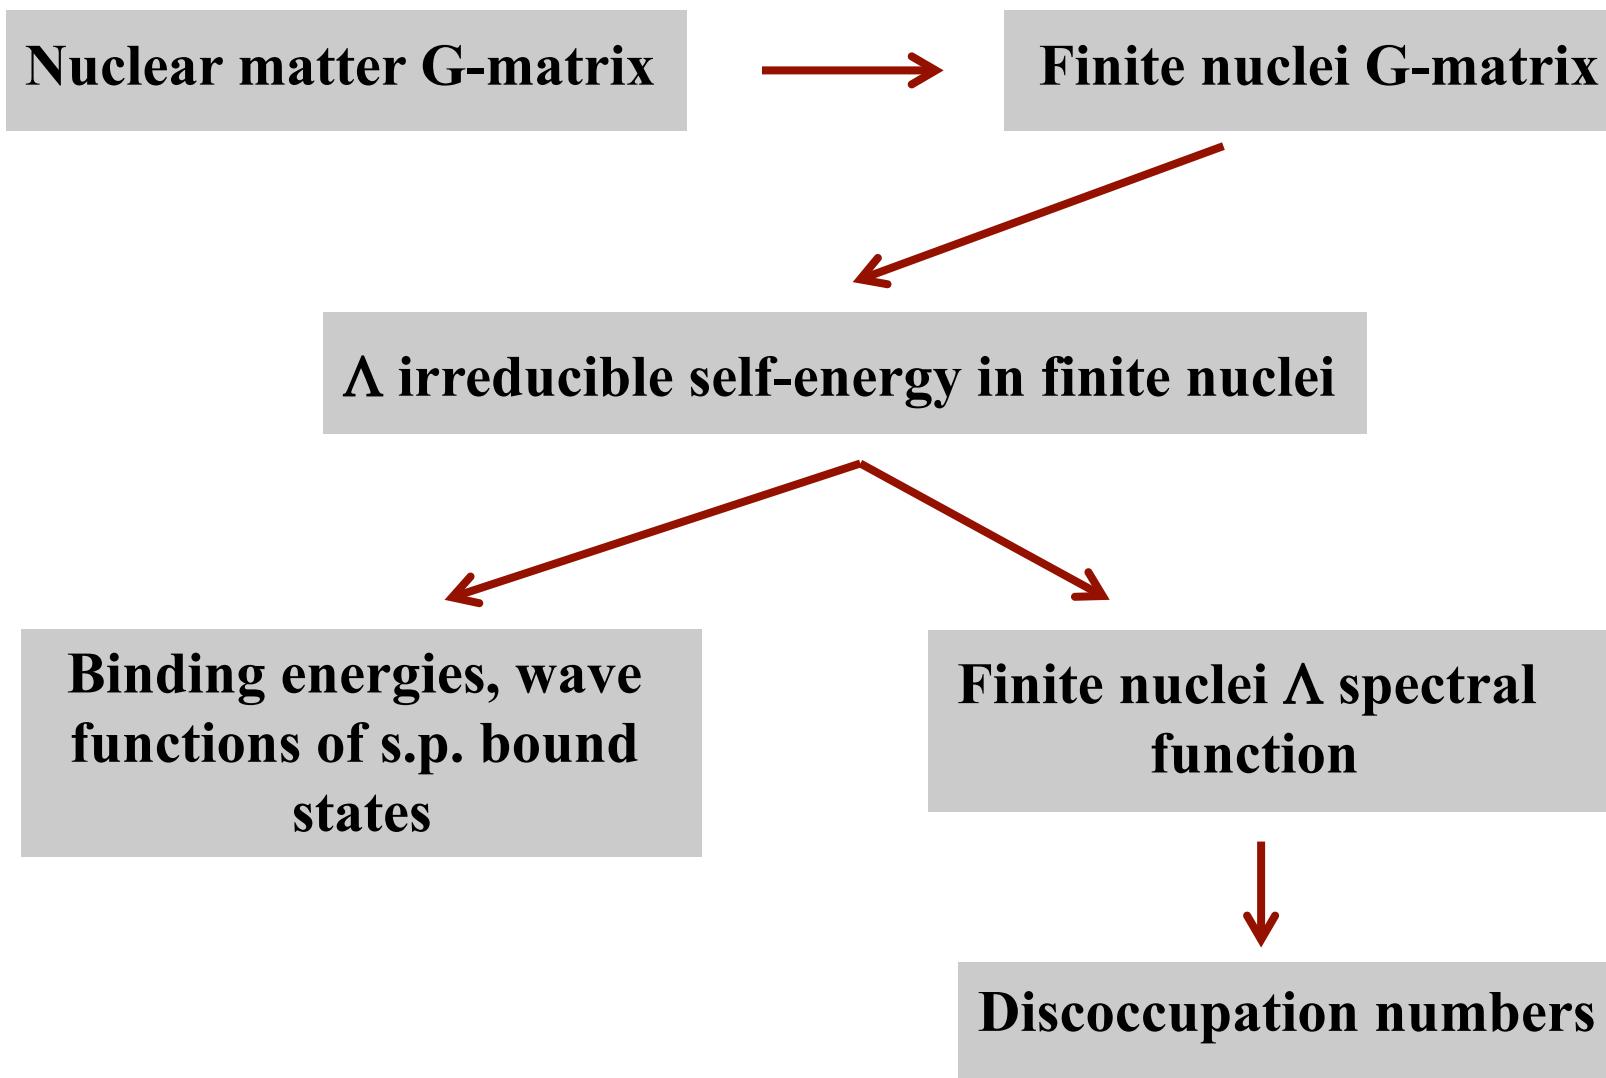

WASA at GSI/FAIR
27-28 November 2017, GSI

Motivation

- ✧ Most of the theoretical descriptions of single Λ -hypernuclei rely on the **validity of the mean field picture**
- ✧ **Correlations induced by the YN interaction** can, however, substantially change this picture and, therefore, **should not be ignored**
- ✧ The knowledge of the **single-particle spectral function of the Λ in finite nuclei** is fundamental to determine:
 - ✓ To which extent the mean field description of hypernuclei is valid
 - ✓ To describe properly the cross section of different production mechanisms of hypernuclei
- ✧ Information on the **Λ spectral function** can be obtained from a combined analysis of data provided by e.g., $(e,e'K^+)$ reactions or other experiments with theoretical calculations

Scheme of the Calculation

Finite nuclei hyperon-nucleon G-matrix

- Finite nuclei G-matrix
- Nuclear matter G-matrix

$$G_{FN} = V + V \left(\frac{Q}{E} \right)_{FN} G_{FN}$$

$$G_{NM} = V + V \left(\frac{Q}{E} \right)_{NM} G_{NM}$$

Eliminating V:

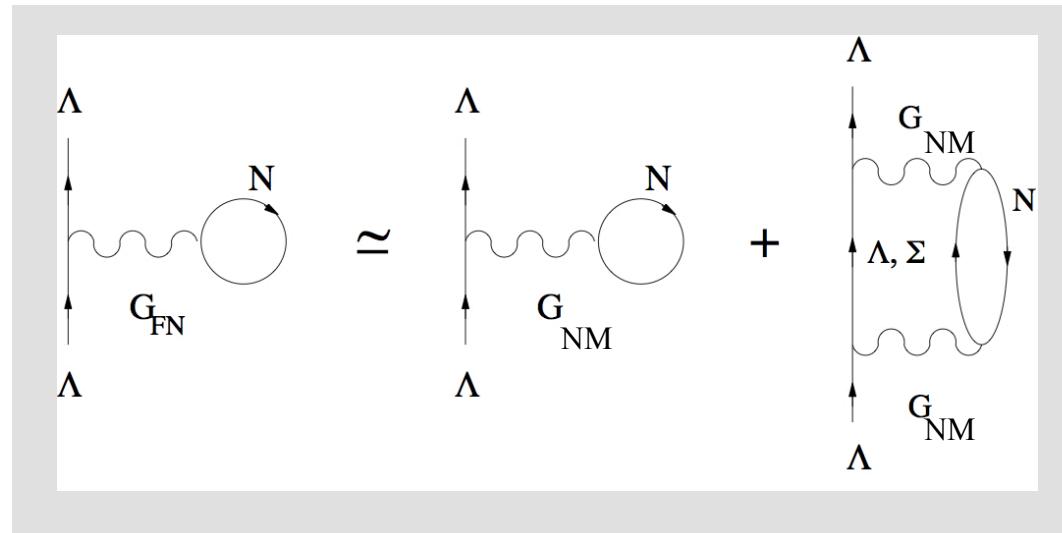

$$G_{FN} = G_{NM} + G_{NM} \left[\left(\frac{Q}{E} \right)_{FN} - \left(\frac{Q}{E} \right)_{NM} \right] G_{FN}$$

Truncating the expansion up second order:

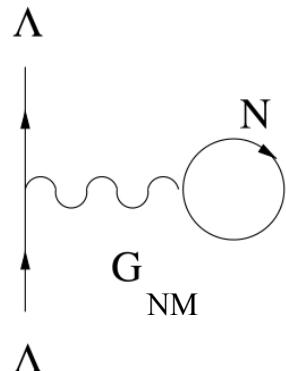

$$G_{FN} \approx G_{NM} + G_{NM} \left[\left(\frac{Q}{E} \right)_{FN} - \left(\frac{Q}{E} \right)_{NM} \right] G_{NM}$$

Finite nucleus Λ self-energy in the BHF approximation

Using G_{FN} as an effective YN interaction, the finite nucleus Λ self-energy is given as sum of a 1st order term & a 2p1h correction

✧ 1st order term

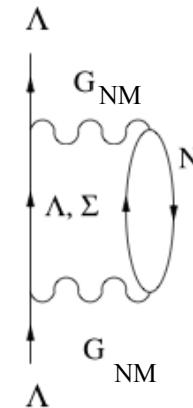

$$\mathcal{V}_1(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda) = \frac{1}{2j_\Lambda + 1} \sum_{\mathcal{J}} \sum_{n_h l_h j_h t_{z_h}} (2\mathcal{J} + 1) \\ \times \langle (k'_\Lambda l_\Lambda j_\Lambda) (n_h l_h j_h t_{z_h}) \mathcal{J} | G | (k_\Lambda l_\Lambda j_\Lambda) (n_h l_h j_h t_{z_h}) \mathcal{J} \rangle$$

This contribution is **real** & energy-independent

✧ 2p1h correction

This contribution is the sum of two terms:

- The first, due to the piece $G_{NM}(Q/E)_{FN}G_{NM}$, gives rise to an imaginary energy-dependent part in the Λ self-energy

$$\begin{aligned}
 & \mathcal{W}_{2p1h}(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda, \omega) \\
 &= -\frac{\pi}{2j_\Lambda + 1} \sum_{n_h l_h j_h t_{z_h}} \sum_{\mathcal{L} \mathcal{L} S J \mathcal{J}} \sum_{Y' = \Lambda \Sigma} \int dq q^2 \int dK K^2 (2\mathcal{J} + 1) \\
 & \quad \times \langle (k'_\Lambda l_\Lambda j_\Lambda) (n_h l_h j_h t_{z_h}) \mathcal{J} | G | K \mathcal{L} q L S J \mathcal{J} T M_T \rangle \\
 & \quad \times \langle K \mathcal{L} q L S J \mathcal{J} T M_T | G | (k_\Lambda l_\Lambda j_\Lambda) (n_h l_h j_h t_{z_h}) \mathcal{J} \rangle \\
 & \quad \times \delta \left(\omega + \varepsilon_h - \frac{\hbar^2 K^2}{2(m_N + m_{Y'})} - \frac{\hbar^2 q^2 (m_N + m_{Y'})}{2m_N m_{Y'}} - m_{Y'} + m_\Lambda \right)
 \end{aligned}$$

From which can be obtained the contribution to the real part of the self-energy through a dispersion relation

$$\mathcal{V}_{2p1h}^{(1)}(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda, \omega) = \frac{1}{\pi} \mathcal{P} \int_{-\infty}^{\infty} d\omega' \frac{\mathcal{W}_{2p1h}(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda, \omega')}{\omega' - \omega}$$

- The second, due to the piece $G_{NM}(Q/E)_{NM}G_{NM}$, gives also a real & energy-independent contribution to the Λ self-energy and avoids double counting of Y'N states

$$\begin{aligned}
& \mathcal{V}_{2p1h}^{(2)}(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda) \\
&= \frac{1}{2j_\Lambda + 1} \sum_{n_h l_h j_h t_{z_h}} \sum_{\mathcal{L}LSJ} \sum_{\mathcal{J}Y'=\Lambda\Sigma} \int dq q^2 \int dK K^2 (2\mathcal{J}+1) \\
&\quad \times \langle (k'_\Lambda l_\Lambda j_\Lambda) (n_h l_h j_h t_{z_h}) \mathcal{J} | G | K \mathcal{L} q L S J \mathcal{J} T M_T \rangle \\
&\quad \times \langle K \mathcal{L} q L S J \mathcal{J} T M_T | G | (k_\Lambda l_\Lambda j_\Lambda) (n_h l_h j_h t_{z_h}) \mathcal{J} \rangle \\
&\quad \times Q_{Y'N} \left(\Omega - \frac{\hbar^2 K^2}{2(m_N + m_{Y'})} - \frac{\hbar^2 q^2 (m_N + m_{Y'})}{2m_N m_{Y'}} - m_{Y'} + m_\Lambda \right)^{-1}
\end{aligned}$$

Summarizing, in the BHF approximation the finite nucleus Λ self-energy is given by:

$$\Sigma_{l_\Lambda j_\Lambda}(k_\Lambda, k'_\Lambda, \omega) = \mathcal{V}_{l_\Lambda j_\Lambda}(k_\Lambda, k'_\Lambda, \omega) + i\mathcal{W}_{l_\Lambda j_\Lambda}(k_\Lambda, k'_\Lambda, \omega)$$

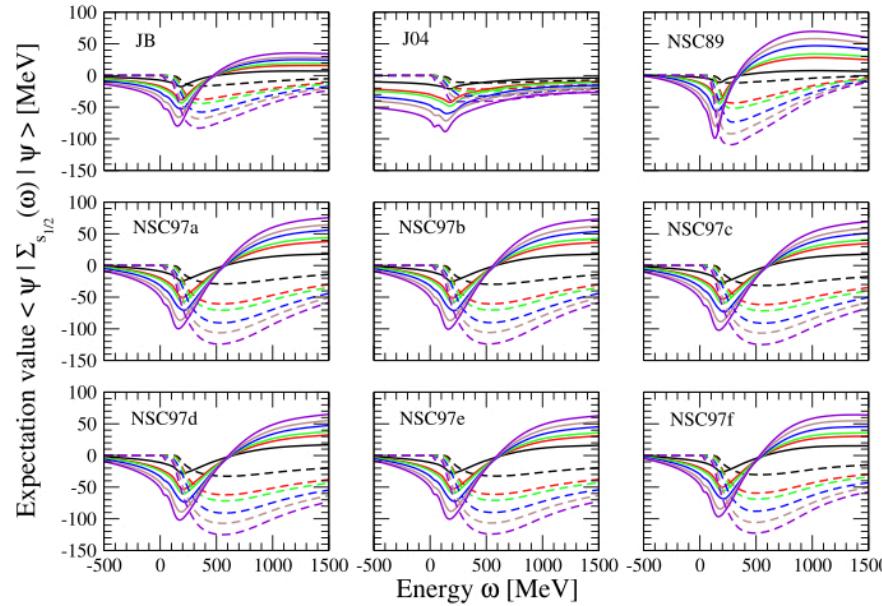

with

$$\mathcal{V}_{l_\Lambda j_\Lambda}(k_\Lambda, k'_\Lambda, \omega) = \mathcal{V}_1(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda) + \mathcal{V}_{2p1h}^{(1)}(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda, \omega) - \mathcal{V}_{2p1h}^{(2)}(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda)$$

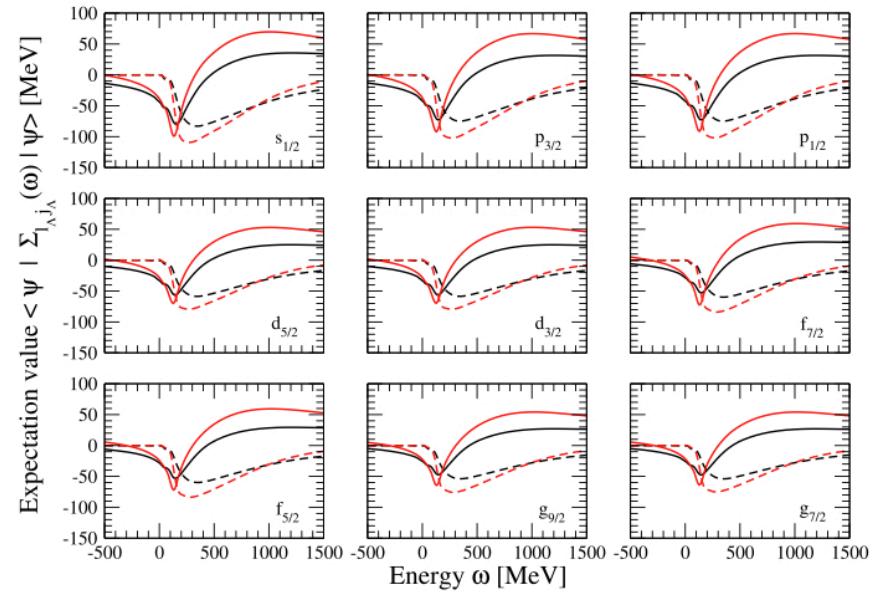

$$\mathcal{W}_{l_\Lambda j_\Lambda}(k_\Lambda, k'_\Lambda, \omega) = \mathcal{W}_{2p1h}(k_\Lambda, k'_\Lambda, l_\Lambda, j_\Lambda, \omega)$$

Λ self-energy in finite nuclei

s-wave state: He (black), C (red), O (green),
Ca (blue), Zr (brown) & Pb (violet)

s-, p-, d-, f- and g- wave states for Pb
JB (black) & NSC89 (red)

- ❖ $|\text{Im } \langle \Psi | \Sigma | \Psi \rangle|$ larger in Nijmegen models → strong ω dependence of $\text{Re } \langle \Psi | \Sigma | \Psi \rangle$
- ❖ $\text{Im } \langle \Psi | \Sigma | \Psi \rangle \neq 0$ only for $\omega > 0$ & always negative
- ❖ $\text{Im } \langle \Psi | \Sigma | \Psi \rangle$ behaves almost quadratically for energies close to $\omega = 0$
- ❖ $\text{Re } \langle \Psi | \Sigma | \Psi \rangle$ attractive for $\omega < 0$ up to a given value of ω turning repulsive at high ω
- ❖ Up to 500-600 MeV $\text{Re } \langle \Psi | \Sigma | \Psi \rangle$ more attractive for heavier hypernuclei. At higher ω more repulsive than that of lighter ones

Λ single-particle bound states

Λ s.p. bound states can be obtained using the real part of the Λ self-energy as an effective hyperon-nucleous potential in the Schoedinger equation

$$\sum_{i=1}^{N_{\max}} \left[\frac{\hbar^2 k_i^2}{2m_\Lambda} + \mathcal{V}_{l_\Lambda j_\Lambda}(k_n, k_i, \omega = \varepsilon_{l_\Lambda j_\Lambda}) \right] \Psi_{il_\Lambda j_\Lambda m_{j_\Lambda}} = \varepsilon_{l_\Lambda j_\Lambda} \Psi_{nl_\Lambda j_\Lambda m_{j_\Lambda}}$$

solved by diagonalizing the Hamiltonian in a complete & orthonormal set of regular basis functions within a spherical box of radius R_{box}

$$\Phi_{nl_\Lambda j_\Lambda m_{j_\Lambda}}(\vec{r}) = \langle \vec{r} | k_n l_\Lambda j_\Lambda m_{j_\Lambda} \rangle = N_{nl_\Lambda} j_{l_\Lambda}(k_n r) \psi_{l_\Lambda j_\Lambda m_{j_\Lambda}}(\theta, \phi)$$

- N_{nl_Λ} \longrightarrow normalization constant
- N_{\max} \longrightarrow maximum number of basis states in the box
- $j_{j_\Lambda}(k_n r)$ \longrightarrow Bessel functions for discrete momenta ($j_{j_\Lambda}(k_n R_{\text{box}})=0$)
- $\psi_{l_\Lambda j_\Lambda m_{j_\Lambda}}(\theta, \phi)$ \longrightarrow spherical harmonics the including spin d.o.f.
- $\Psi_{nl_\Lambda j_\Lambda m_{j_\Lambda}} = \langle k_n l_\Lambda j_\Lambda m_{j_\Lambda} | \Psi \rangle$ \longrightarrow projection of the state $|\Psi\rangle$ on the basis $|k_n l_\Lambda j_\Lambda m_{j_\Lambda}\rangle$

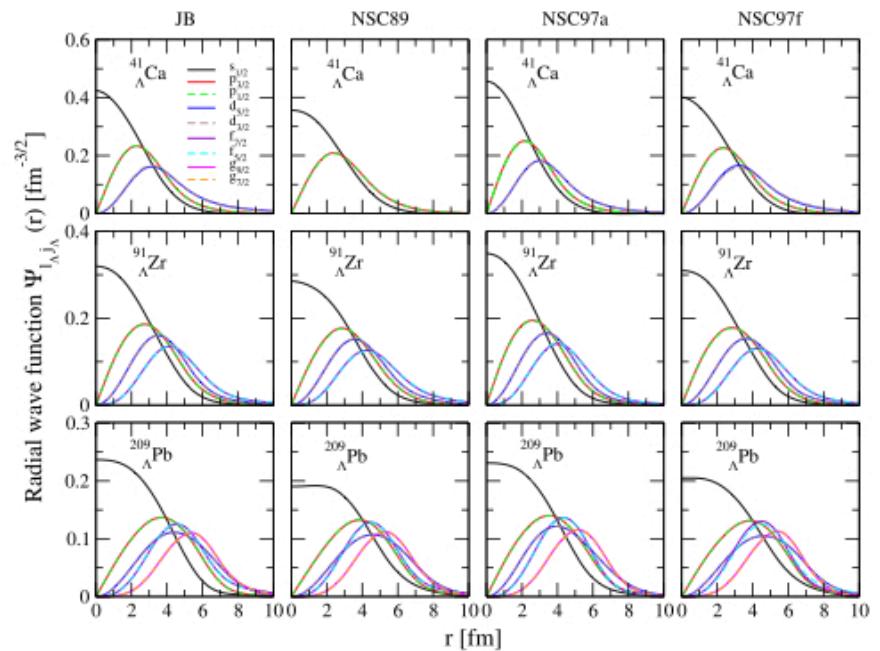

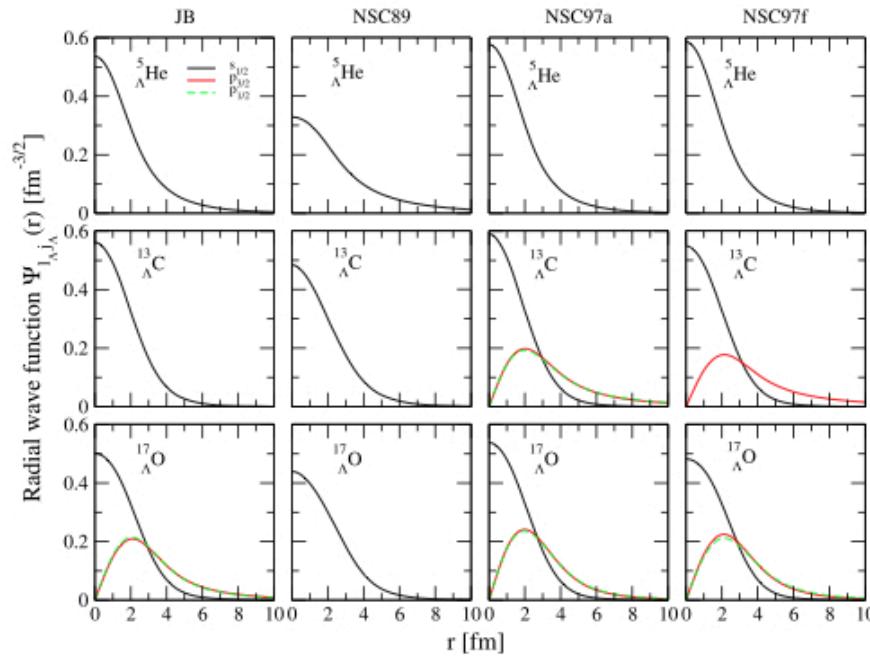

N.B. a self-consistent procedure is required for each eigenvalue

- ❖ Qualitatively good agreement with experiment, except for J04 (unrealistic overbinding)
- ❖ Zr & Pb overbound also for NSC97a-f models. These models predict $U_\Lambda(0) \sim -40$ MeV compared with -30 MeV extrapolated from data
- ❖ Splitting of p-, d-, f- and g-waves of \sim few tenths of MeV due to the small spin-orbit strength of YN interaction

Λ single-particle bound states: Radial Wave Function

- ❖ $\Psi_{s1/2}$ state more and more spread when going from light to heavy hypernuclei \longrightarrow probability of finding the Λ at the center of the hypernuclei ($|\Psi_{s1/2}(r=0)|^2$) decreases.
- ❖ Only He falls out this pattern because the energy of the $s_{1/2}$ state is too low, therefore, resulting in a very extended wave function
- ❖ The small spin-orbit splitting of the p-, d-, f- and g-wave states cannot be resolved in the corresponding wave functions

General Remarks on the s.p. Spectral Function

Single-particle Green's function (Lehmann representation):

$$g_{\alpha\beta}(\omega) = \int_{E_0^{N+1}-E_0^N}^{\infty} d\omega' \frac{S_{\alpha\beta}^p(\omega')}{\omega - \omega' + i\eta} + \int_{-\infty}^{E_0^N-E_0^{N-1}} d\omega' \frac{S_{\alpha\beta}^h(\omega')}{\omega - \omega' - i\eta}$$

Describes propagation of a particle or a hole added to a N-particle system

being

$$S_{\alpha\beta}^p(\omega) = \sum_m \langle \Psi_0^N | \hat{c}_\alpha | \Psi_m^{N+1} \rangle \langle \Psi_m^{N+1} | \hat{c}_\beta^\dagger | \Psi_0^N \rangle \delta(\omega - (E_m^{N+1} - E_0^N)), \quad \omega > E_0^{N+1} - E_0^N$$

Particle & hole part of the s.p. spectral function

$$S_{\alpha\beta}^h(\omega) = \mp \sum_n \langle \Psi_0^N | \hat{c}_\beta^\dagger | \Psi_n^{N-1} \rangle \langle \Psi_n^{N-1} | \hat{c}_\alpha | \Psi_0^N \rangle \delta(\omega - (E_0^N - E_n^{N-1})), \quad \omega < E_0^N - E_0^{N-1}$$

Diagonal parts of $S_{\alpha\beta}^p$ & $S_{\alpha\beta}^h$ = probability density of adding or removing a particle to the ground state of the N-particle system & finding the resulting N+1 (N-1) one with energy $\omega - (E_m^{N+1} - E_0^N)$ or $(E_0^N - E_n^{N-1}) - \omega$

The case of the single-particle Λ spectral function

In the case of a Λ hyperon that is added to a pure nucleonic system (e.g., infinite nuclear matter or an ordinary nuclei), it is clear, that since there are no other Λ 's in the N -particle pure nucleonic system, the Λ can only be added to it and, therefore, **the hole part of its spectral function is zero**

The Lehmann representation of the single- Λ propagator is simply:

$$g_{\alpha\beta}^{\Lambda}(\omega) = \int_{E_0^{N+\Lambda} - E_0^N}^{\infty} d\omega' \frac{S_{\alpha\beta}^{\Lambda p}(\omega')}{\omega - \omega' + i\eta}$$

Λ Spectral Strength

In any production mechanism of single- Λ hypernuclei a Λ can be formed in a bound or in a scattering state \longrightarrow the Λ particle spectral function is sum of a discrete & a continuum contribution

✧ Discrete contribution

$$S_{l_\Lambda j_\Lambda}^{p(d)}(k_n, \omega) = Z_{l_\Lambda j_\Lambda} |\langle k_n l_\Lambda j_\Lambda m_{j_\Lambda} | \Psi \rangle|^2 \delta(\omega - \varepsilon_{l_\Lambda j_\Lambda})$$

is a delta function located at the energy of the s.p. bound state with strength given by the Z-factor

$$Z_{l_\Lambda j_\Lambda} = \left(1 - \frac{\partial \langle \Psi | \Sigma_{l_\Lambda j_\Lambda}(\omega) | \Psi \rangle}{\partial \omega} \Big|_{\omega=\varepsilon_{l_\Lambda j_\Lambda}} \right)^{-1}$$

The **discrete contribution to the total Λ spectral strength** is obtained by summing over all discrete momenta k_n

$$S_{l_\Lambda j_\Lambda}^{p(d)}(\omega) = Z_{l_\Lambda j_\Lambda} \delta(\omega - \varepsilon_{l_\Lambda j_\Lambda})$$

Λ Spectral Strength

❖ Continuum contribution

$$S_{l_\Lambda j_\Lambda}^{p(c)}(k_\Lambda, k'_\Lambda, \omega) = -\frac{1}{\pi} \text{Im } g_{l_\Lambda j_\Lambda}^\Lambda(k_\Lambda, k'_\Lambda, \omega)$$

where the single- Λ propagator can be derived from the following form of the Dyson equation

$$g_{l_\Lambda j_\Lambda}^\Lambda(k_\Lambda, k'_\Lambda, \omega) = \frac{\delta(k_\Lambda - k'_\Lambda)}{k_\Lambda^2} \underbrace{g_\Lambda^{(0)}(k_\Lambda, \omega)}_{\text{Free s.p. propagator}} + \underbrace{g_\Lambda^{(0)}(k_\Lambda, \omega) \Sigma_{l_\Lambda j_\Lambda}^{red}(k_\Lambda, k'_\Lambda, \omega) g_\Lambda^{(0)}(k'_\Lambda, \omega)}_{\text{Reducible } \Lambda \text{ self-energy}}$$

Free s.p. propagator Reducible Λ self-energy

$$\Sigma_{l_\Lambda j_\Lambda}^{red}(k_\Lambda, k'_\Lambda, \omega) = \Sigma_{l_\Lambda j_\Lambda}(k_\Lambda, k'_\Lambda, \omega) + \int dq_\Lambda q_\Lambda^2 \Sigma_{l_\Lambda j_\Lambda}(k_\Lambda, q_\Lambda, \omega) g_\Lambda^{(0)}(q_\Lambda, \omega) \Sigma_{l_\Lambda j_\Lambda}^{red}(q_\Lambda, k'_\Lambda, \omega)$$

Λ Spectral Strength

Due to the delta function in the Dyson equation is numerically more convenient to obtain the continuum contribution of the Λ spectral function in coordinate space

$$S_{l_\Lambda j_\Lambda}^{p(c)}(r_\Lambda, r'_\Lambda, \omega) = \frac{2}{\pi} \int_0^\infty dk_\Lambda k_\Lambda^2 \int_0^\infty dk'_\Lambda k'_\Lambda{}^2 j_{l_\Lambda}(k_\Lambda r_\Lambda) S_{l_\Lambda j_\Lambda}^{p(c)}(k_\Lambda, k'_\Lambda, \omega) j_{l_\Lambda}(k'_\Lambda r'_\Lambda)$$

The **continuum contribution to the total Λ spectral strength** is obtained from the following double folding of the spectral function

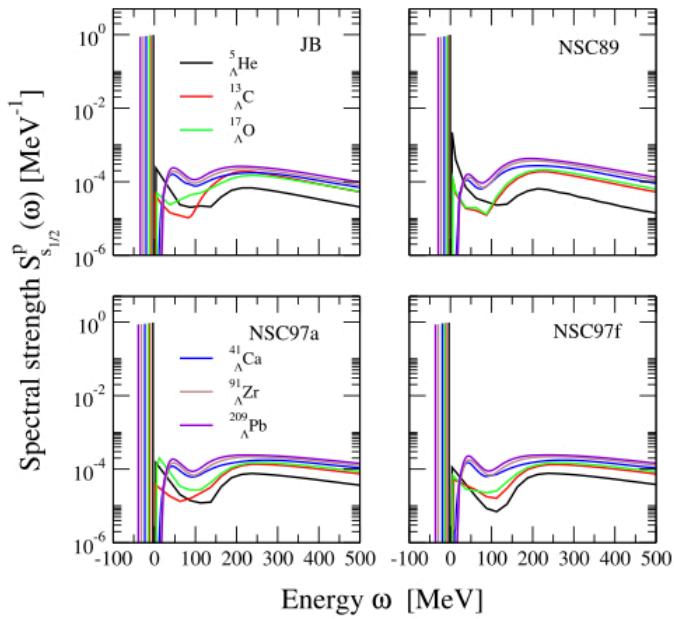

$$S_{l_\Lambda j_\Lambda}^{p(c)}(\omega) = \int_0^\infty dr_\Lambda r_\Lambda^2 \int_0^\infty dr'_\Lambda r'_\Lambda{}^2 \Psi_{l_\Lambda j_\Lambda}(r_\Lambda) S_{l_\Lambda j_\Lambda}^{p(c)}(r_\Lambda, r'_\Lambda, \omega) \Psi_{l_\Lambda j_\Lambda}(r'_\Lambda)$$

Total Λ spectral strength

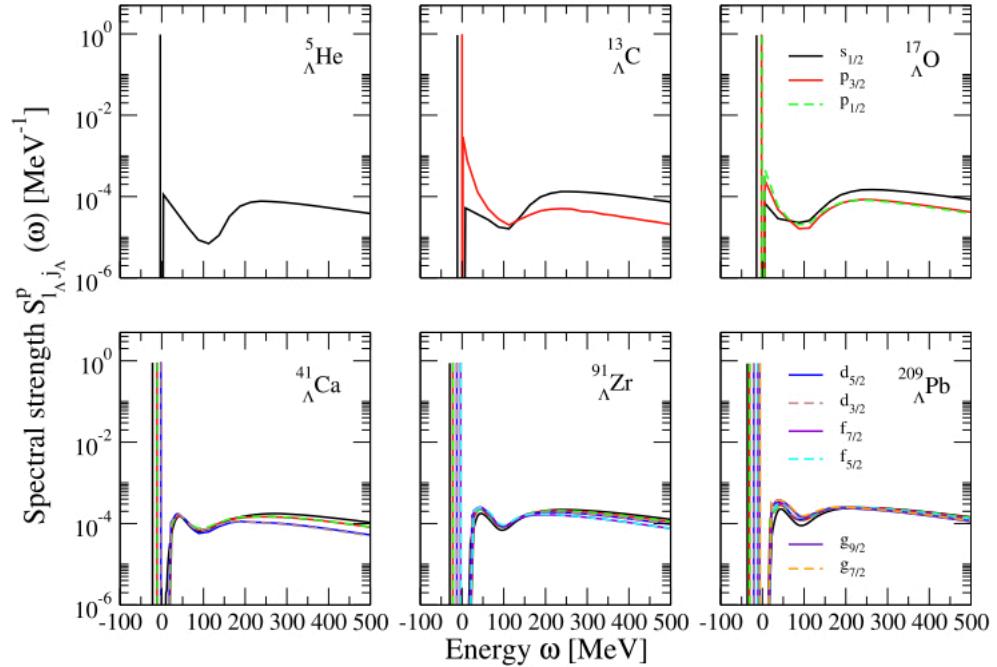

$$S_{l_\Lambda j_\Lambda}^p(\omega) = S_{l_\Lambda j_\Lambda}^{p(d)}(\omega) + S_{l_\Lambda j_\Lambda}^{p(c)}(\omega)$$

Λ Spectral Strength: Results

s-wave state: He (black), C (red), O (green), Ca (blue), Zr (brown) & Pb (violet)

s-, p-, d-, f- and g- wave states (NSC97f)

- ✧ **Discrete contribution:** delta function located at the energy of the s.p. bound state with strength given by the Z-factor. Decreases when moving from light to heavy nuclei $\rightarrow \Lambda N$ correlations more important when density of nuclear core increases
- ✧ **Continuum contribution:** strength spread over all positive energies. Structure for $\omega < 100$ MeV reflects the behavior of self-energy. Monotonically reduction for $\omega > 200$

ΛN correlations: Z-factor

$$Z_{l_\Lambda j_\Lambda} = \left(1 - \frac{\partial \langle \Psi | \Sigma_{l_\Lambda j_\Lambda}(\omega) | \Psi \rangle}{\partial \omega} \Big|_{\omega=\varepsilon_{l_\Lambda j_\Lambda}} \right)^{-1}$$

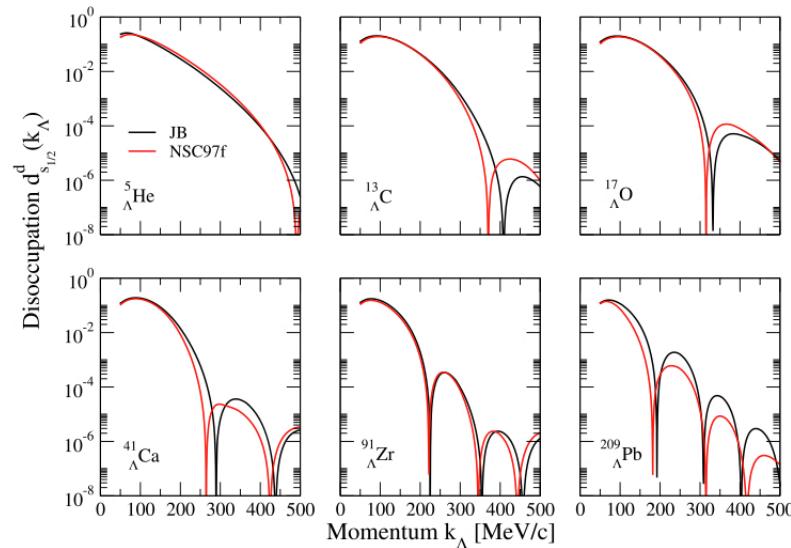

Z measures the importance of correlations. The smaller the value of Z the more important are the correlations of the system

- ❖ Z is relatively large for all hypernuclei → Λ keeps its identity inside the nucleus & is less correlated than nucleons
- ❖ Z decreases from light to heavy hypernuclei → ΛN correlations increase when density of nuclear core increases
- ❖ Z increases when increasing the partial wave → ΛN correlations become less important for higher partial waves

Disoccupation (discrete contribution)

s-wave state: He, C, O, Ca, Zr & Pb
JB (black) & NSC89 (red)

$$d_{l_\Lambda j_\Lambda}^d(k_\Lambda) = \int_{\mu_\Lambda}^{\infty} d\omega S_{l_\Lambda j_\Lambda}^{p(d)}(k_\Lambda, \omega) = Z_{l_\Lambda j_\Lambda} |\langle k_\Lambda l_\Lambda j_\Lambda m_{j_\Lambda} | \Psi \rangle|^2$$

s-, p-, d-, f- and g- wave states for Pb
JB (black) & NSC89 (red)

- ❖ $d_{l_\Lambda j_\Lambda}^d(k_\Lambda)$ gives the probability of adding a Λ of momentum k_Λ in the s.p. state $l_\Lambda j_\Lambda$ of the hypernucleus
- ❖ Intuitively one expects that if K_Λ is large the Λ can easily escape from the nucleus & the probability of binding it must be small. Both plots show in fact that $d_{l_\Lambda j_\Lambda}^d(k_\Lambda)$ decreases when increasing k_Λ and is almost negligible for very large values → In hypernuclear production reactions the Λ is formed in a quasi-free state

Total Disoccupation Number

The total spectral strength of the Λ hyperon fulfills the sum rule

$$\int_{\mu_\Lambda}^{\infty} d\omega S_{l_\Lambda j_\Lambda}^p(\omega) = \underbrace{\int_{\mu_\Lambda}^{\infty} d\omega S_{l_\Lambda j_\Lambda}^{p(d)}(\omega)} + \underbrace{\int_{\mu_\Lambda}^{\infty} d\omega S_{l_\Lambda j_\Lambda}^{p(c)}(\omega)} = 1$$

The total disoccupation number is 1 → is always possible to add a Λ either in a bound or a scattering state of a given ordinary nucleus

The final message of this talk

Nucl. Phys. A 958, 48 (2017)

❖ Purpose:

- ✓ Calculation of finite nuclei Λ spectral function from its self-energy derived within a perturbative many-body approach with realistic YN interactions

❖ Results & Conclusions

- ✓ Binding energies in good agreement with experiment
- ✓ Z-factor relatively large $\longrightarrow \Lambda$ less correlated than nucleons
- ✓ Discrete cont. to disoc. numb decreases with k_Λ $\longrightarrow \Lambda$ is mostly formed in a quasi-free state in production reactions
- ✓ Scattering reactions such as (e,e',K^+) at MAMI-C & JLAB can provide valuable information on the disoccupation of Λ s.p. bound states

- ✧ You for your time & attention
- ✧ The organizers for their invitation
