FACT – the First G-APD Cherenkov Telescope

Status and Experience from Six+ Years Operation of the First SiPM Camera

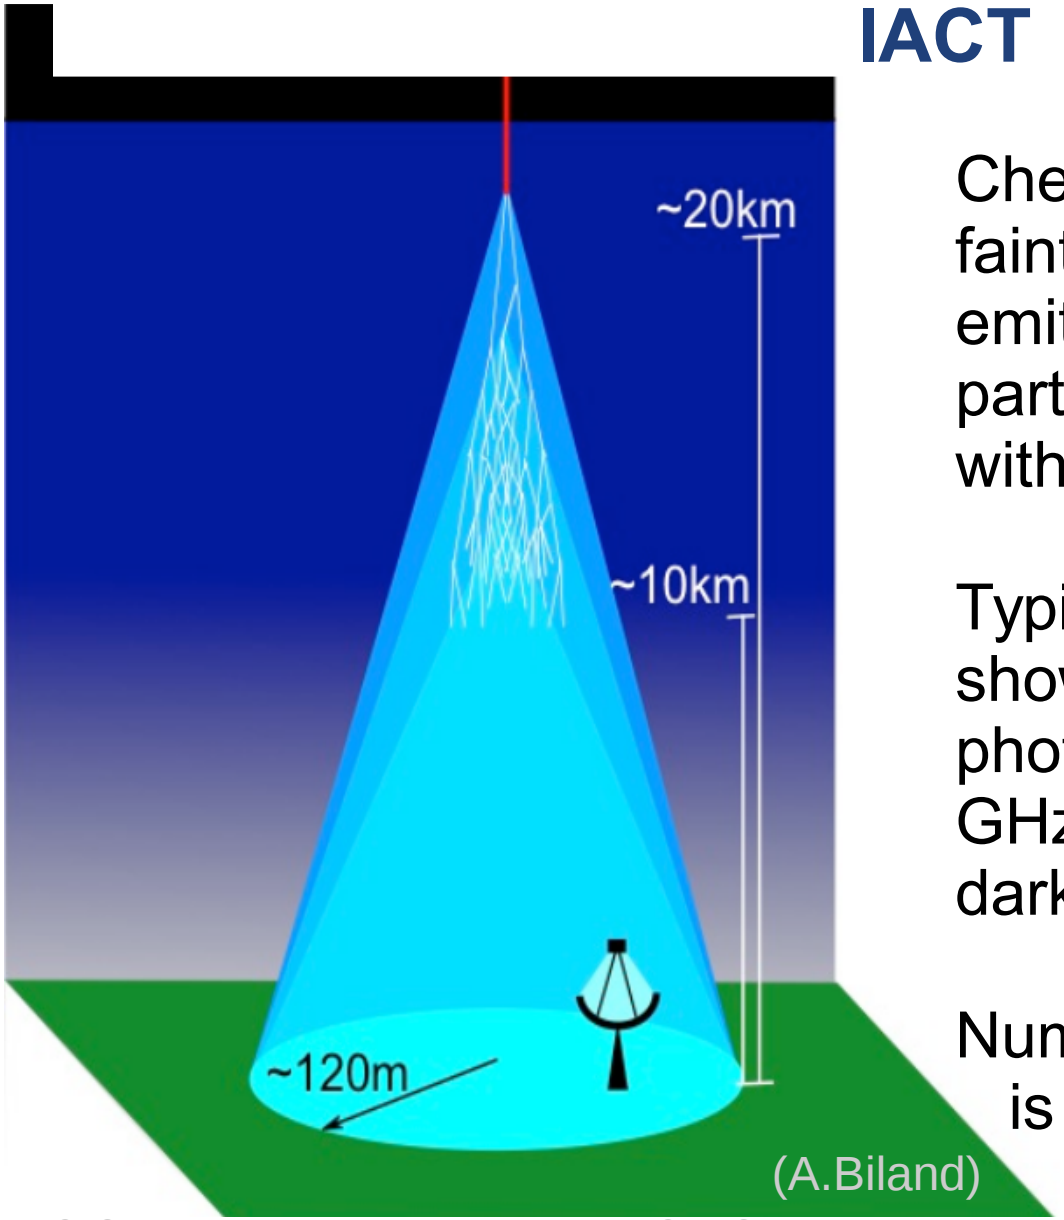
IACT



Cherenkov telescopes measure faint flashes of Cherenkov light emitted when a cosmic ray particle or gamma-ray interacts with the atmosphere.

Typically one measures showers with 50 Cherenkov-photons within few ns over a 50 GHz night sky background for dark night conditions.

Number of Cherenkov Photons is ~proportional to energy of primary particle.

Very harsh
environment
intrinsic
to IACT

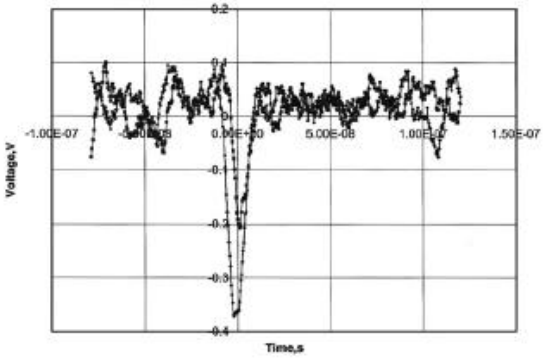
Detailed List of Problems due to G-APD (SiPM)

Detailed List of Problems due to G-APD (SiPM)

thank you for your attention

FACT – History

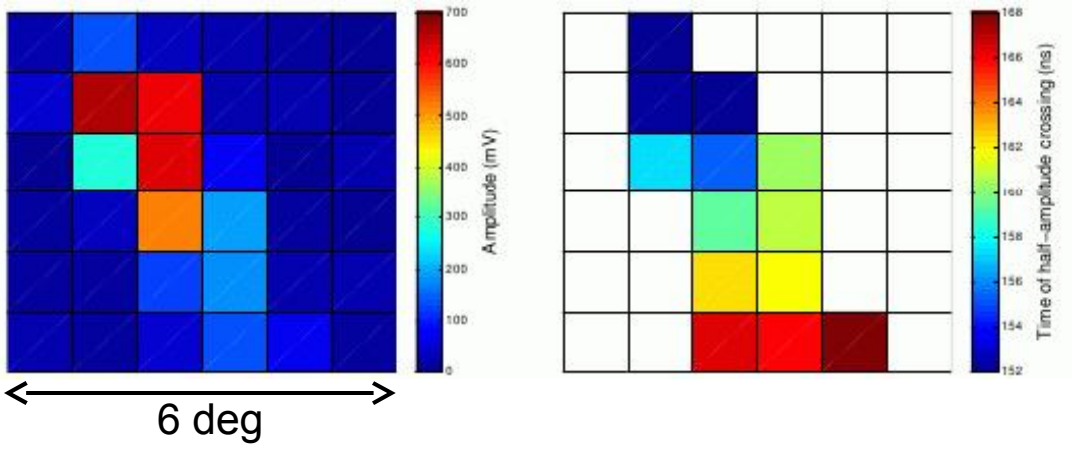
FACT – History



2007: First Cherenkov flashes seen with few G-APDs attached to MAGIC camera [NIM A 581]

2008: Collaboration of ETH Zurich and Universities Dortmund, Geneva, Würzburg (+EPF Lausanne) to build a G-APD based camera for HEGRA CT3

2009: *Module0* (36 pix, 4 G-APD/pix) records self-triggered Cherenkov images from the roof of ETH Zurich [JINST4 P10010] → go for complete camera

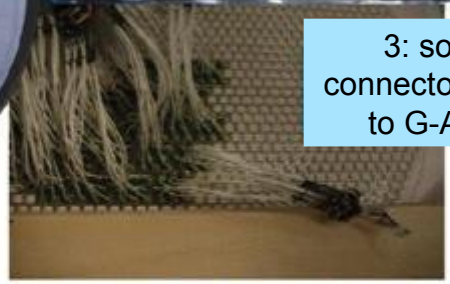


FACT – G-APD Camera

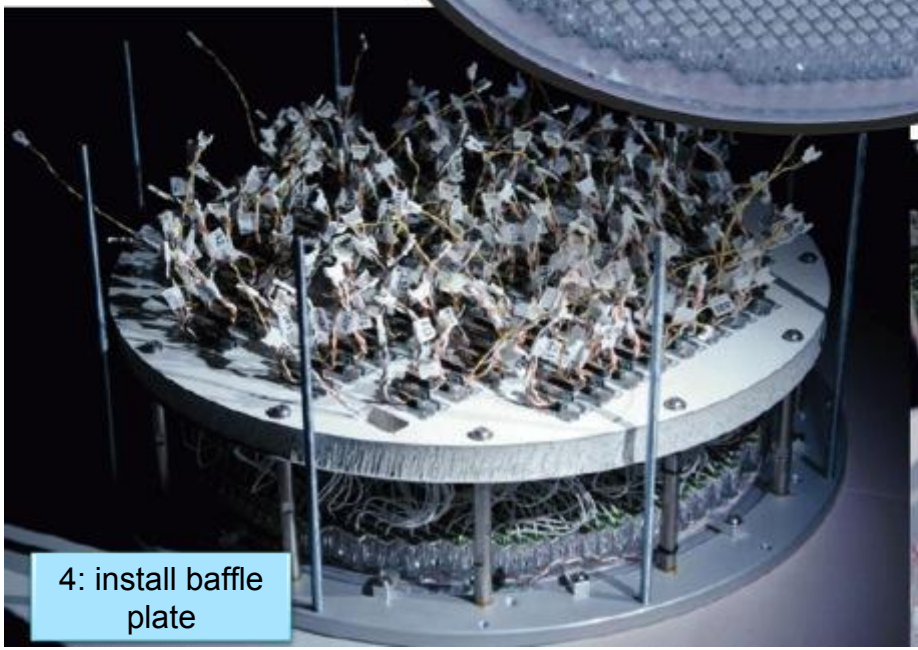
1: glue G-APD to cone

1440 pixels

2: glue cones to front window



3: solder connector cables to G-APDs

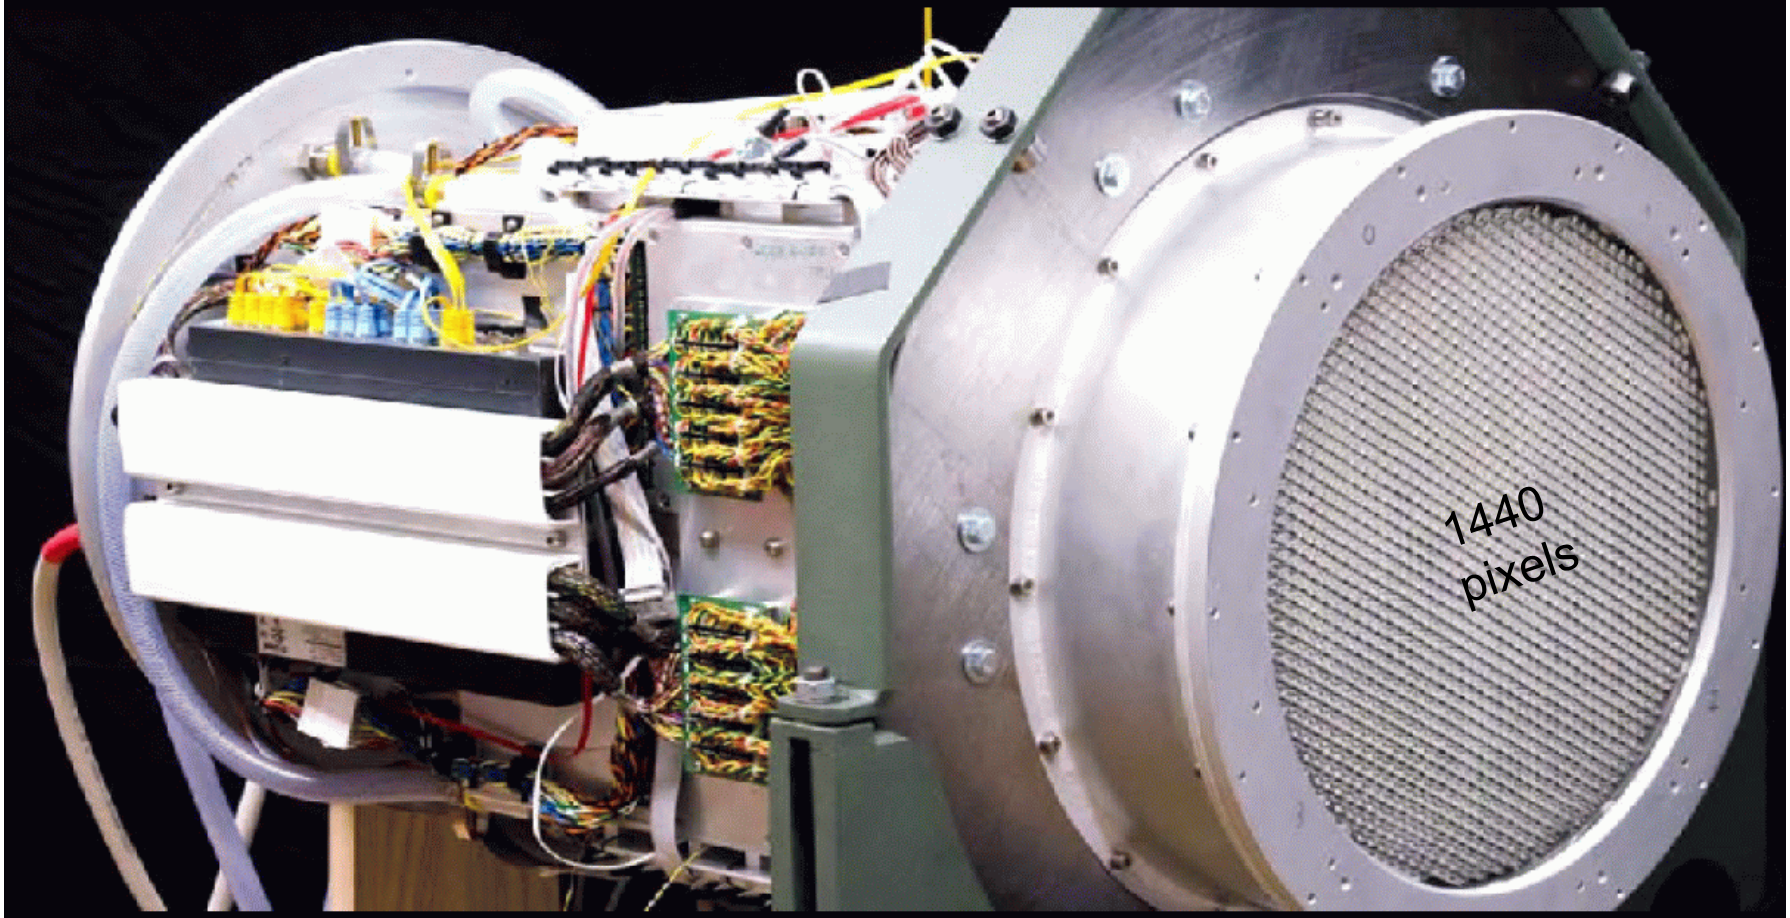


4: install baffle plate

completed sensor plane

Integrated electronics
DRS4 readout

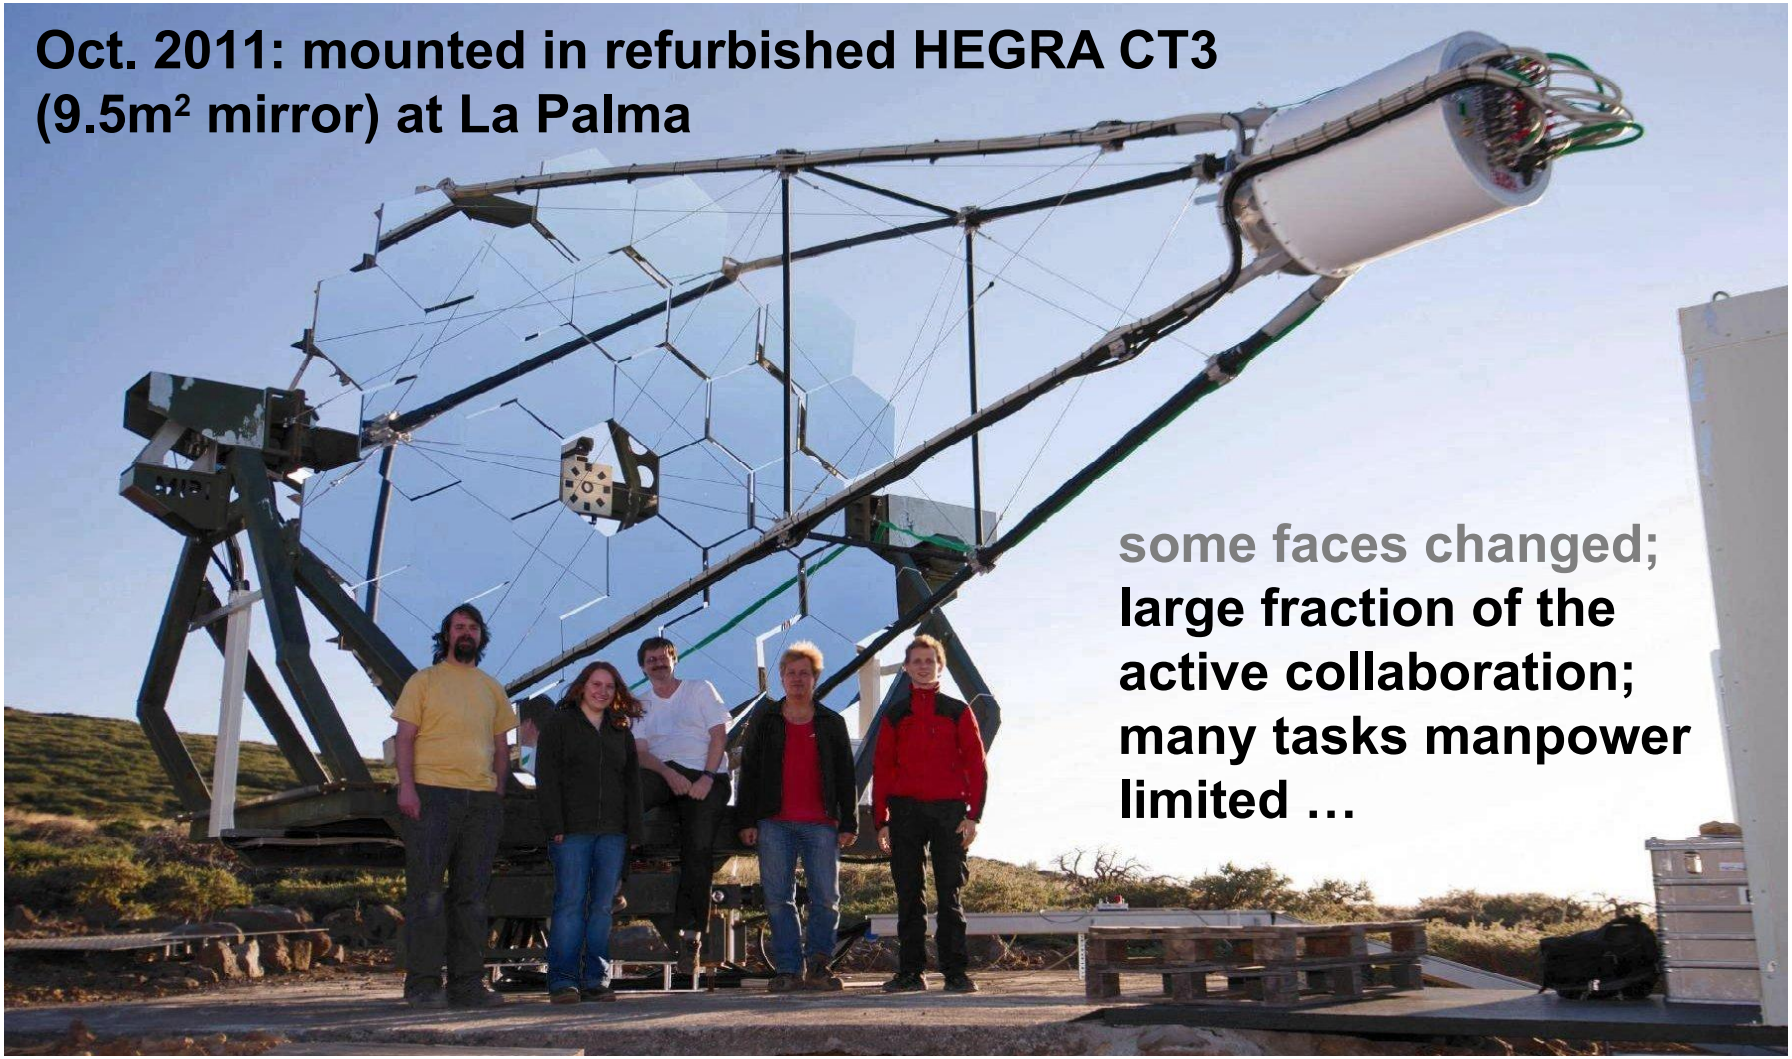
320 bias voltage channels
(1 per 4\5 G-APDs)

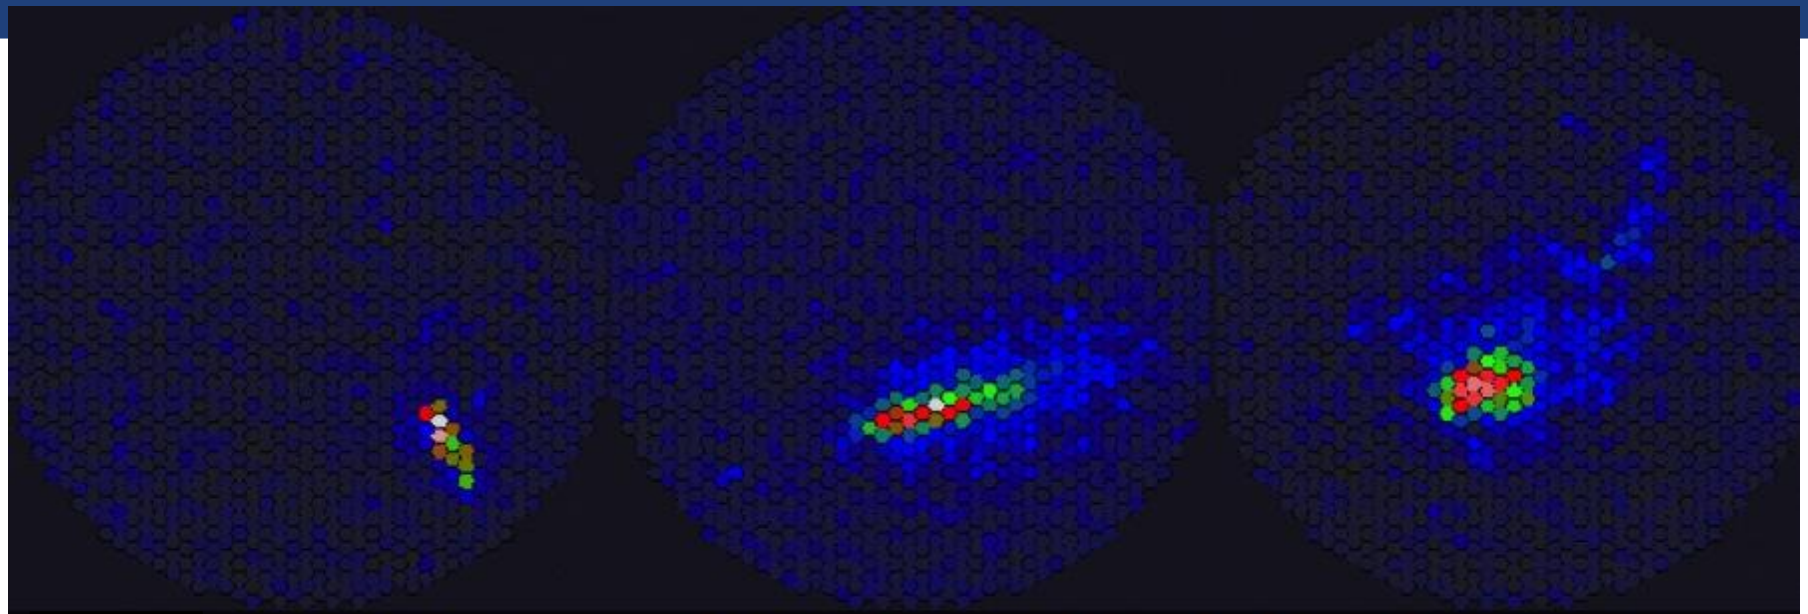


Power consumption ≤500W
Readout via Ethernet

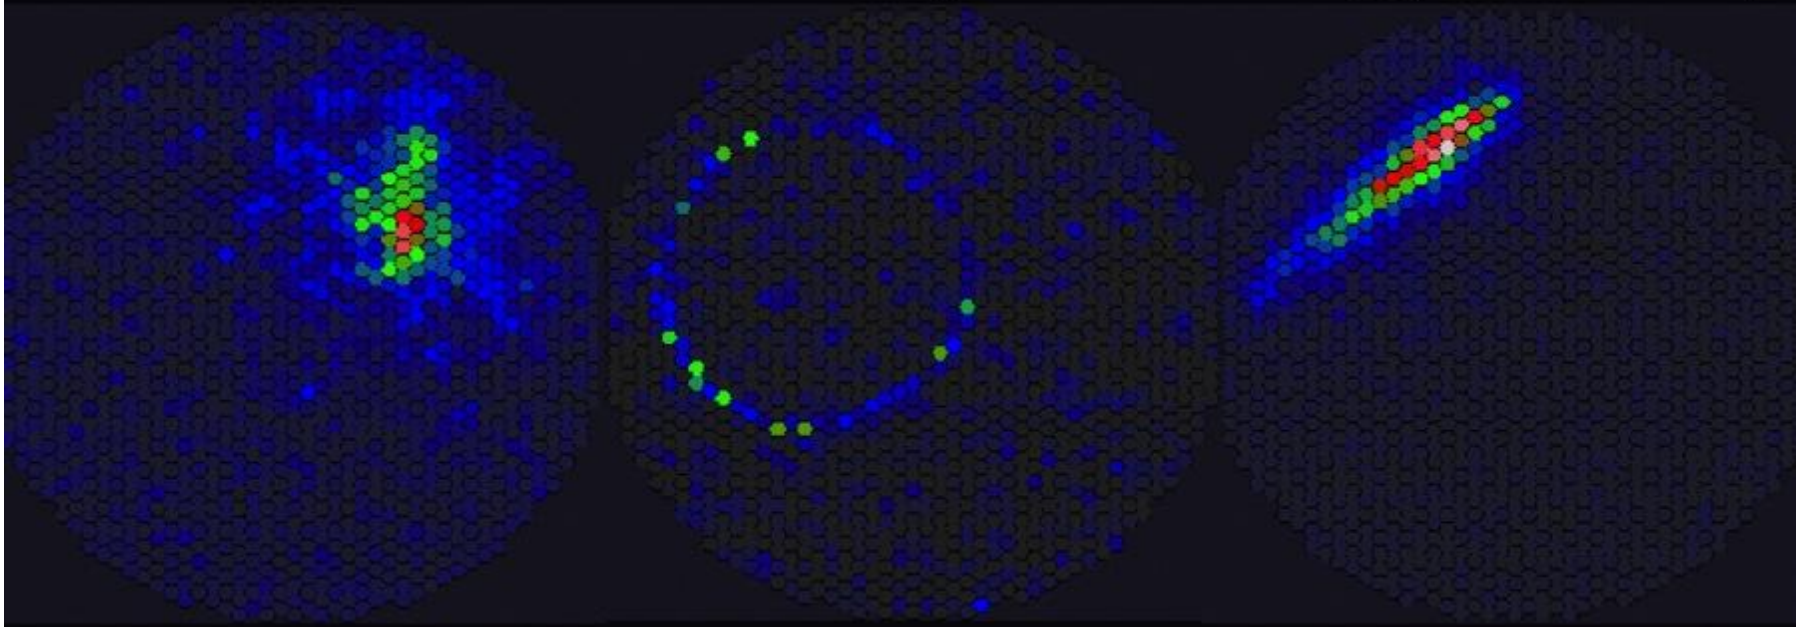
160 trigger patches
(sum of 9 channels)

FACT – the First G-APD Cherenkov Telescope





FACT – Selected events of the first nights of data-taking (October 2011)



FACT – Self-calibrating System

FACT – Uniformity & Stability of Camera

(our) G-APD gain has strong Temperature dependency (~4%/degree)
→ Feedback system → adjust applied voltage to Temp. (and DC)
Nowadays you can even buy power supplies doing this for you.

FACT – Uniformity & Stability of Camera

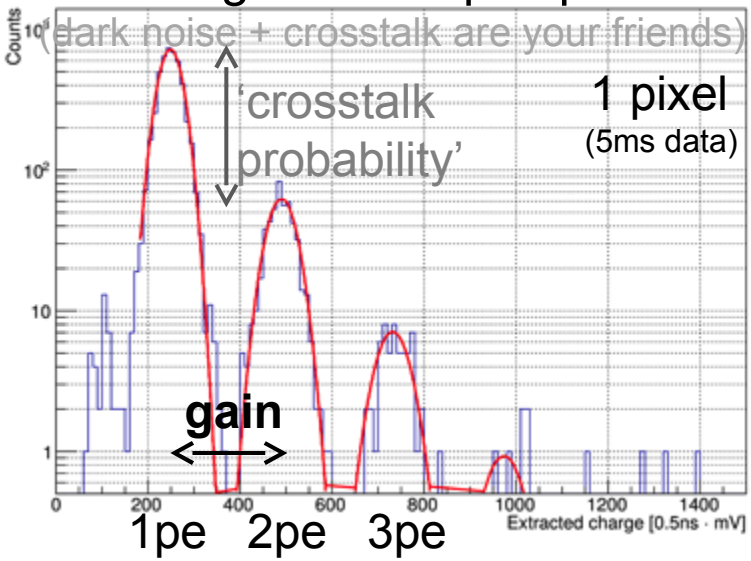
→ Feedback system → adjust applied voltage to Temp. (and DC)
Nowadays you can even buy power supplies doing this for you.

Monitor gain with 1pe spectra:
(dark noise + crosstalk are your friends)



→ dark noise + crosstalk allow calibration without any external device

FACT – Uniformity & Stability of Camera

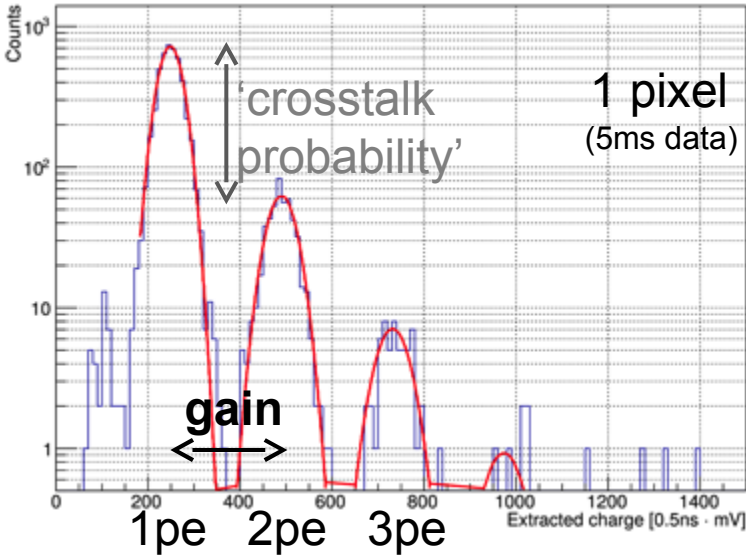
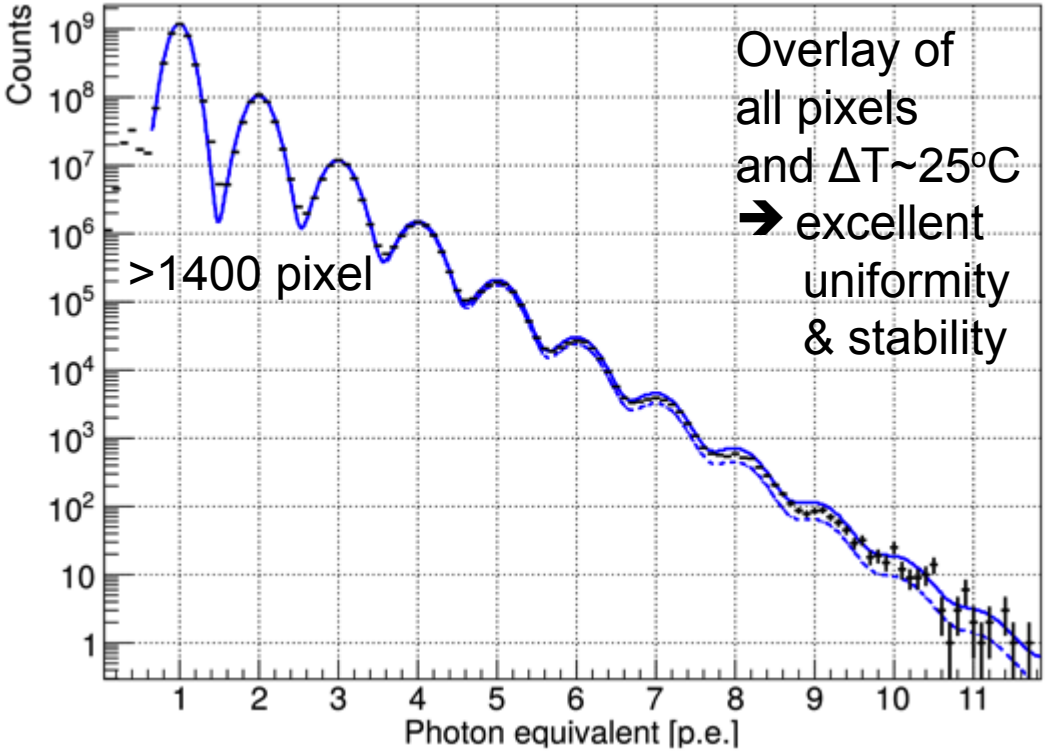
check with 1pe spectra:
(dark noise + crosstalk are your friends)

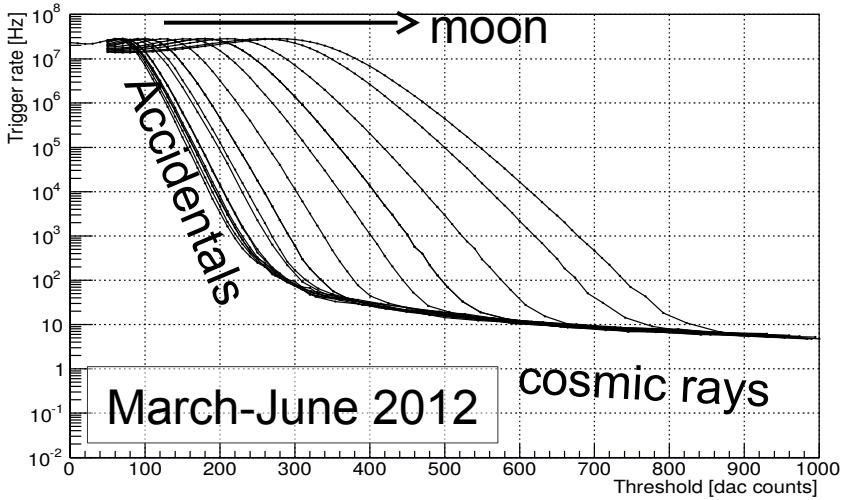


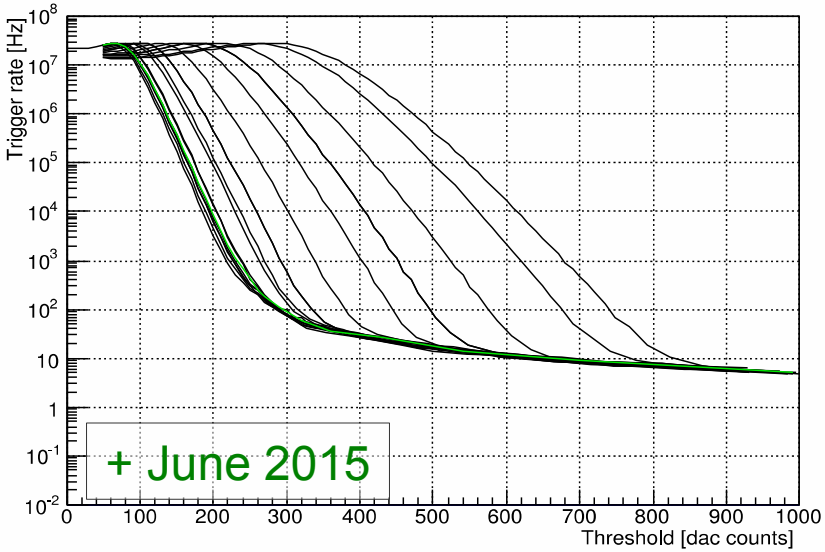


→ dark noise + crosstalk allow calibration without any external device

FACT – Stability of System

For a given pointing, trigger should always see the same rate of cosmic rays.

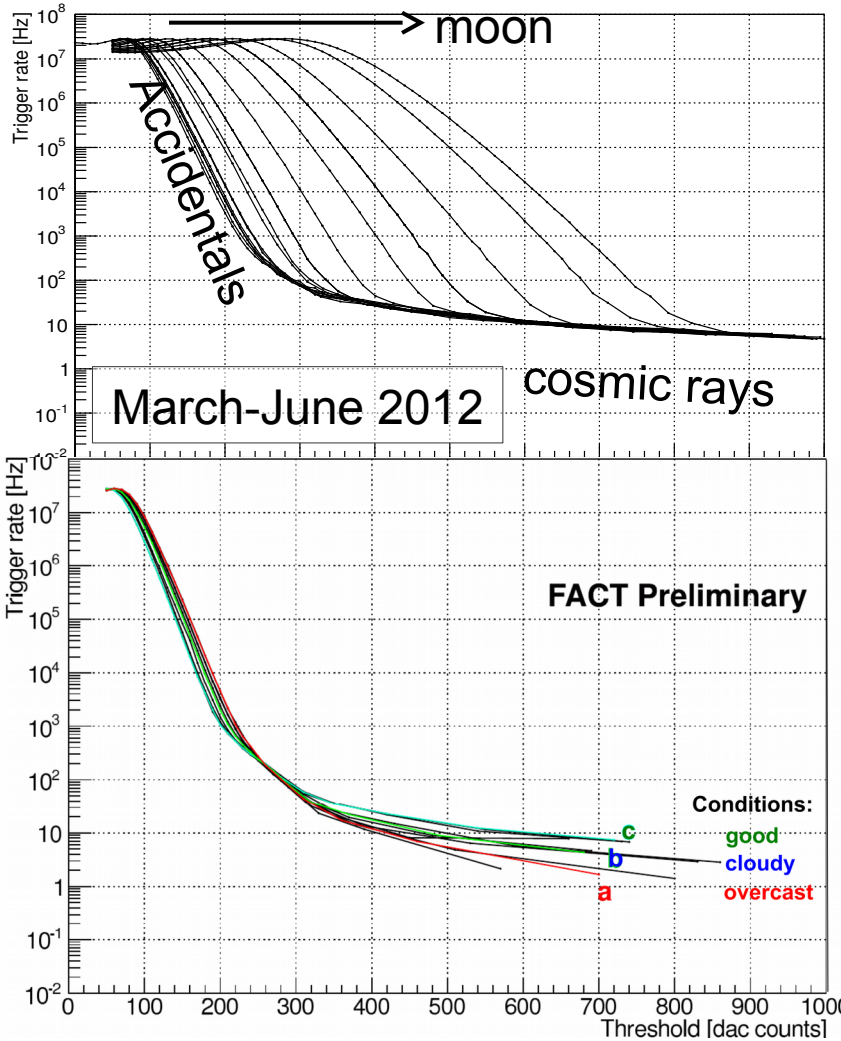


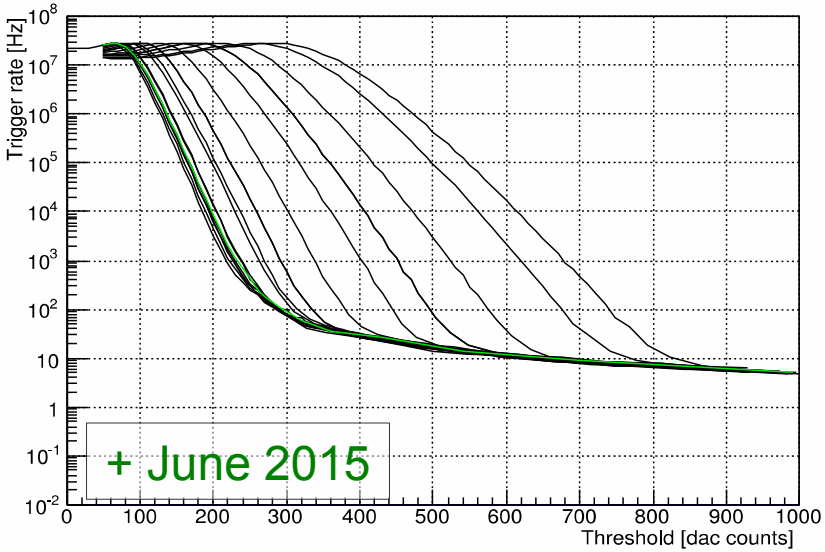


Ratescans show cosmic ray trigger-rate independent of moon, sensor temperature and age of sensors.

FACT – Stability of System

For a given pointing, trigger should always see the same rate of cosmic rays.

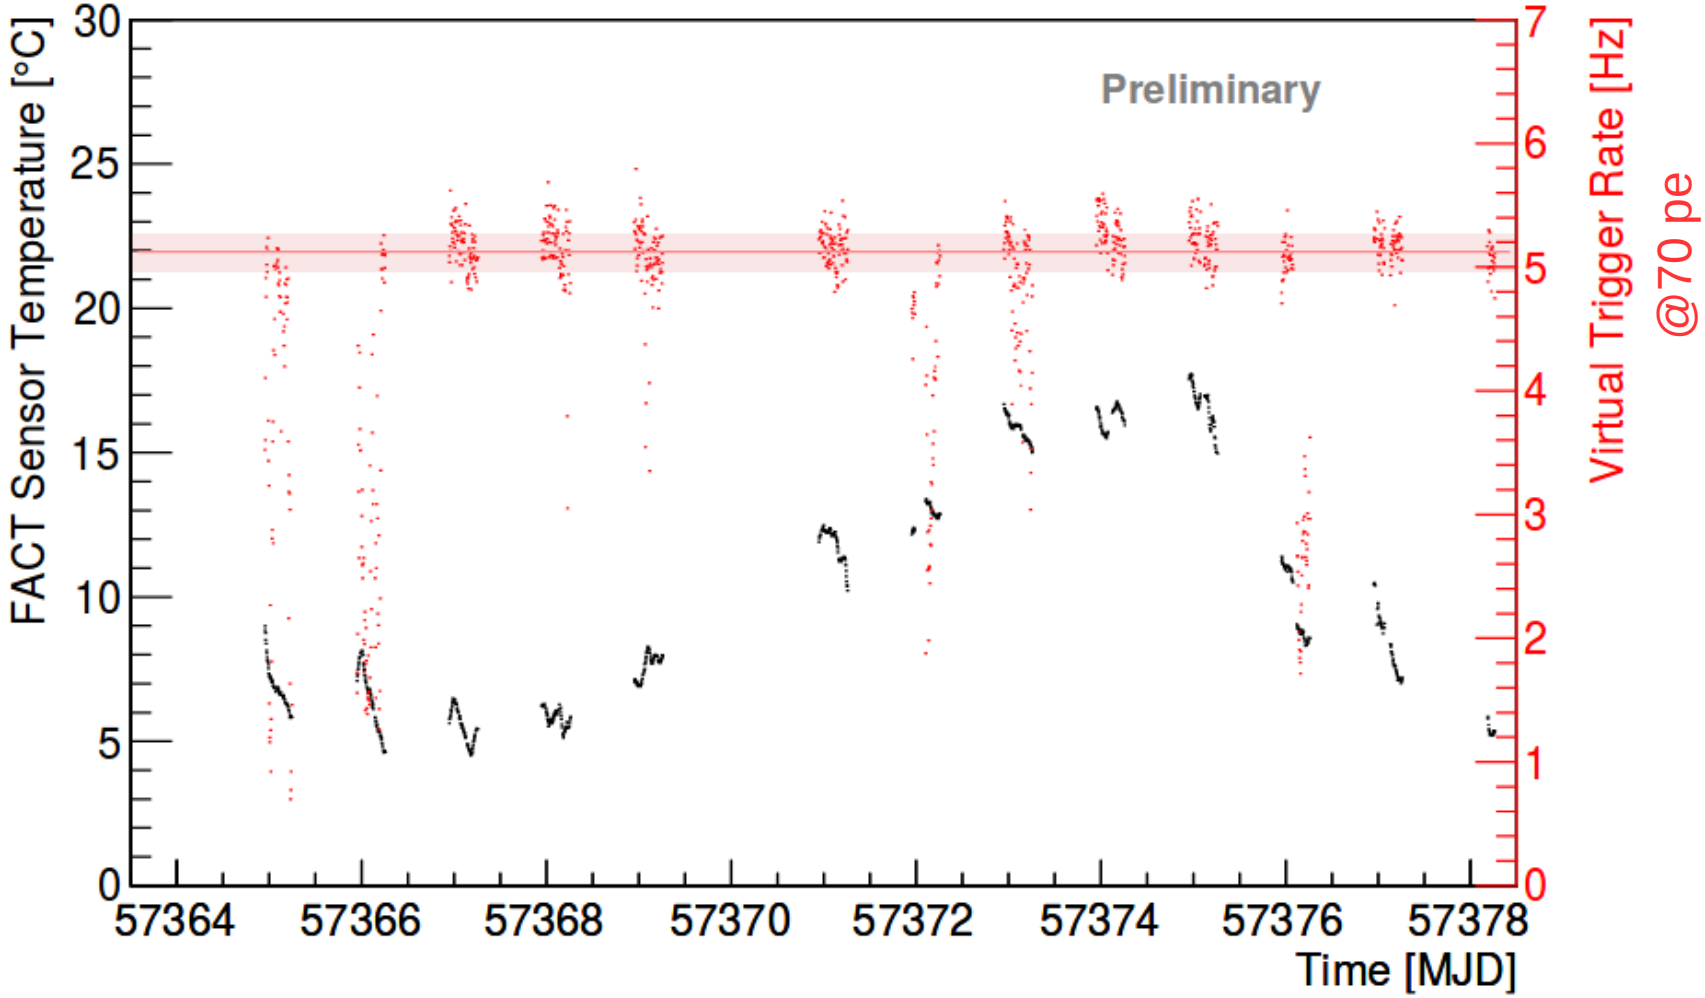




Ratescans show cosmic ray trigger-rate independent of moon, sensor temperature and age of sensors.

Bad atmospheric conditions give us a handle on overall efficiency.

FACT – Stability of 2nd order temperature effects



D. Hildebrand et al., Higher Order Temperature Dependence of SiPM used in FACT, PoS(ICRC2017) 778

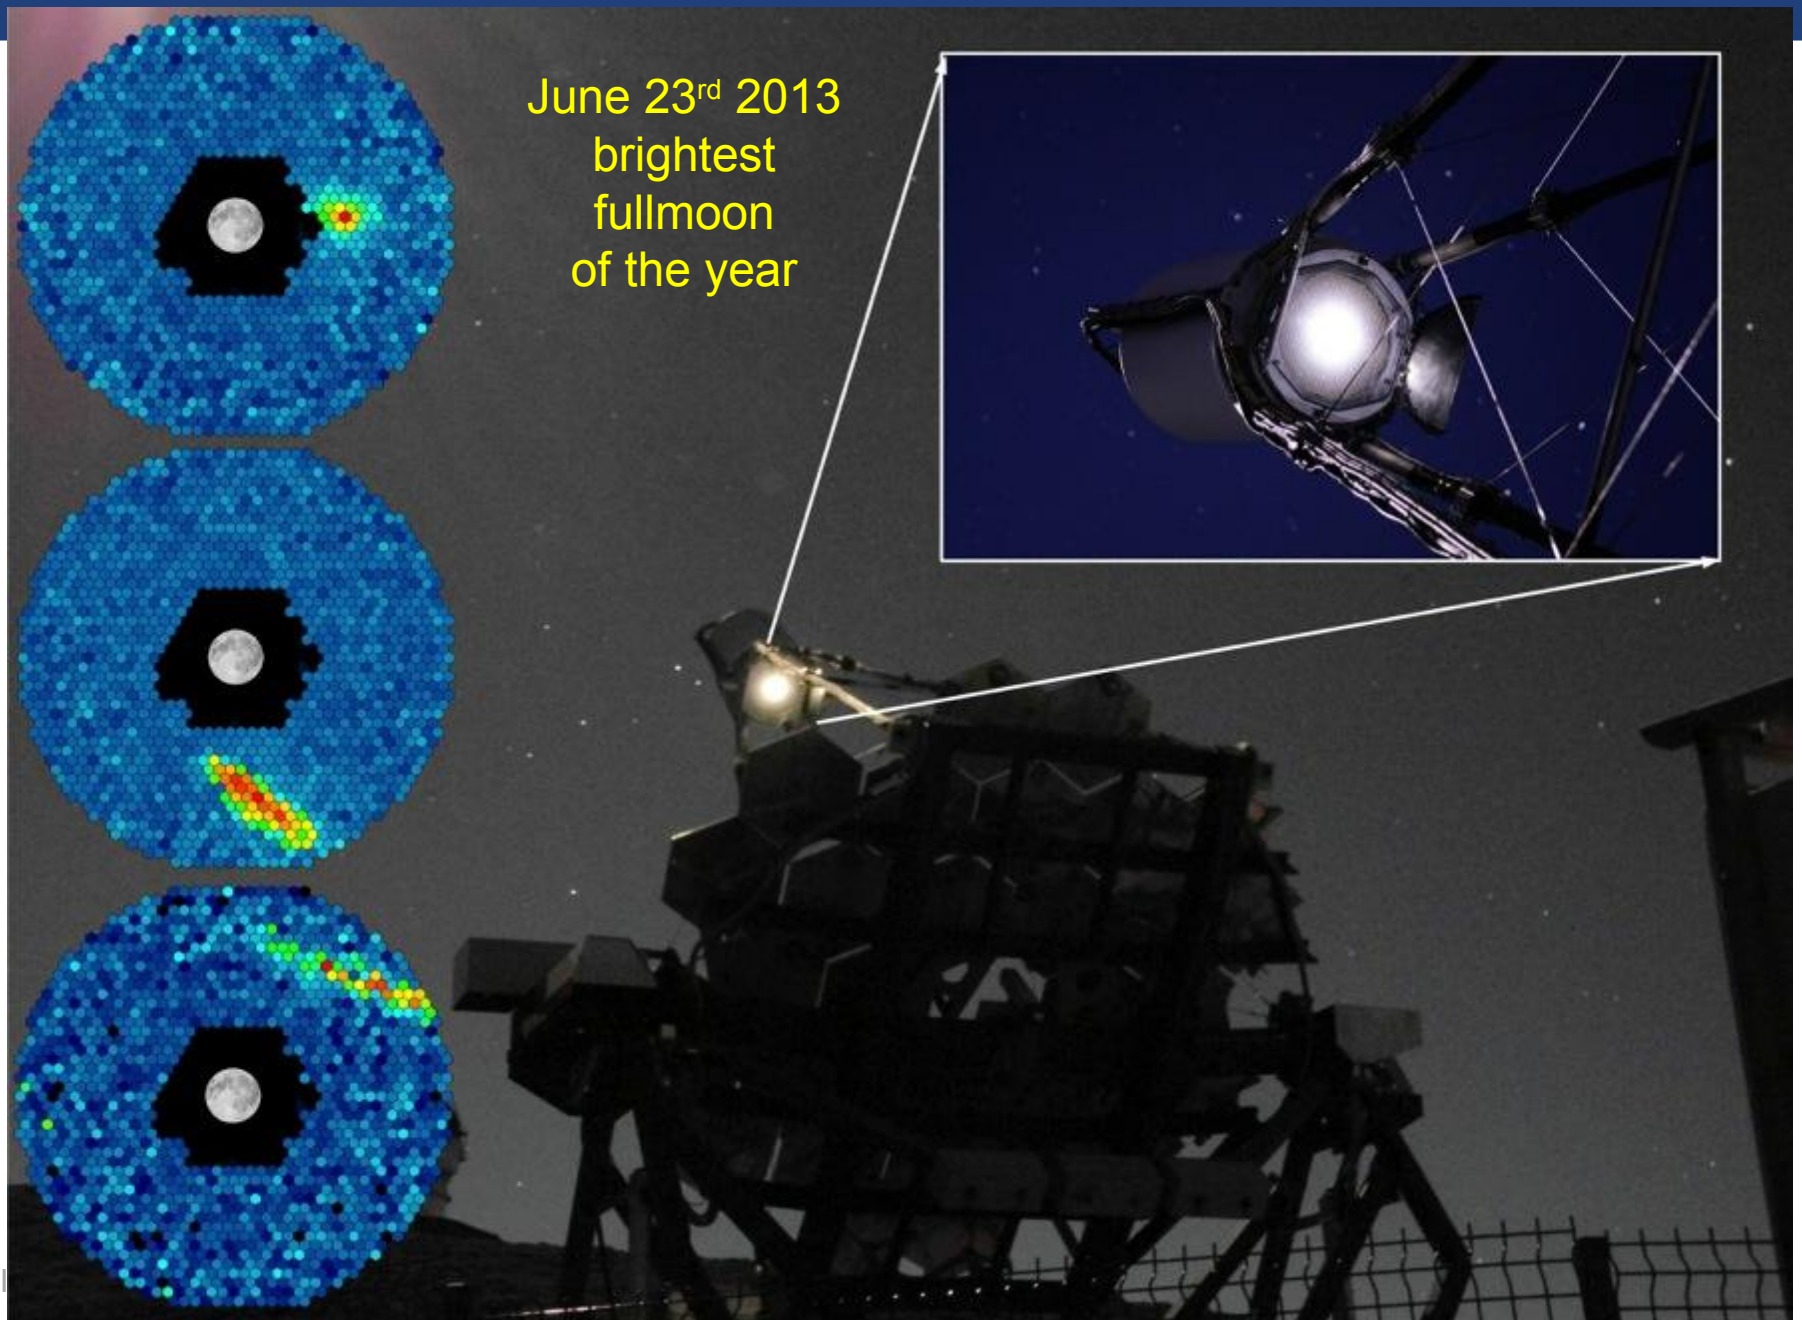
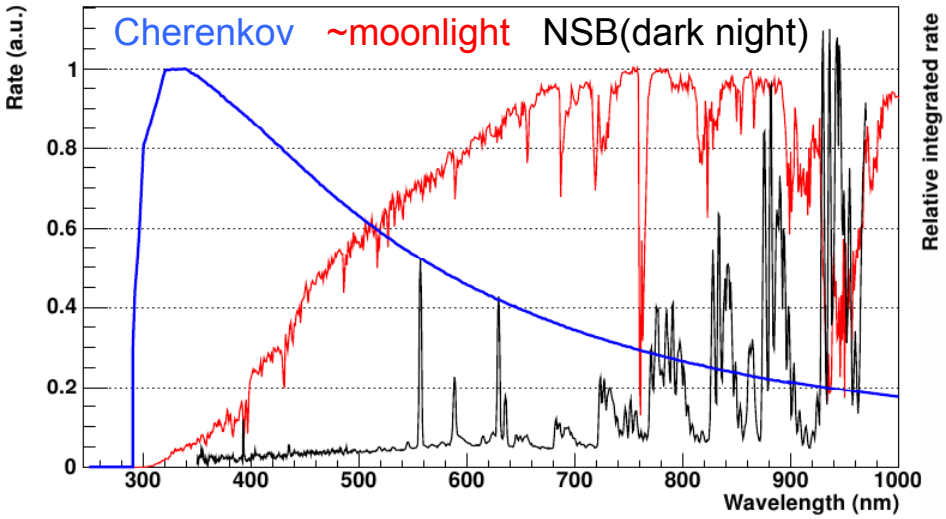
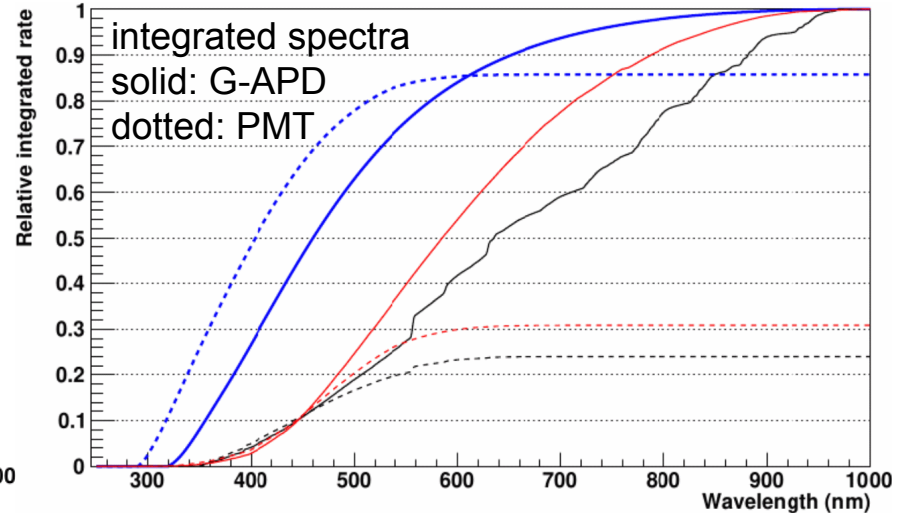
FACT – Longevity

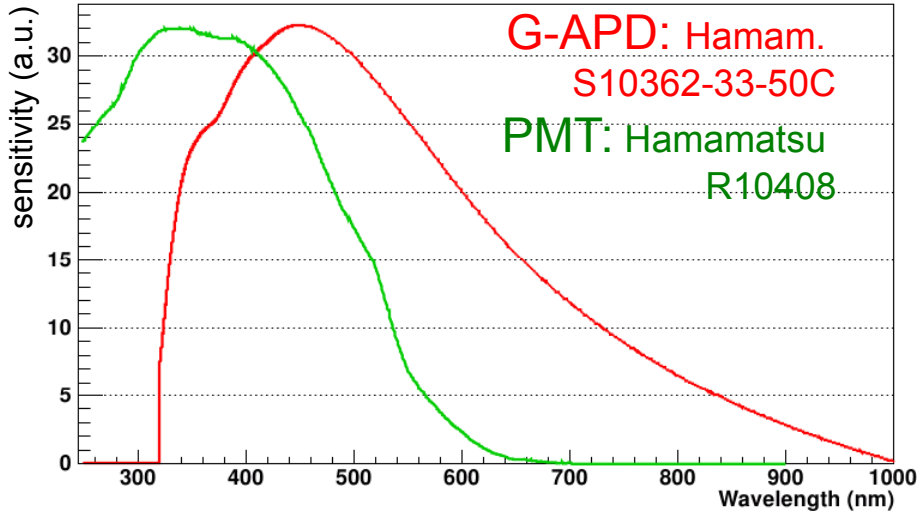


June 23rd 2013
brightest
fullmoon
of the year

FACT – Signal & Background





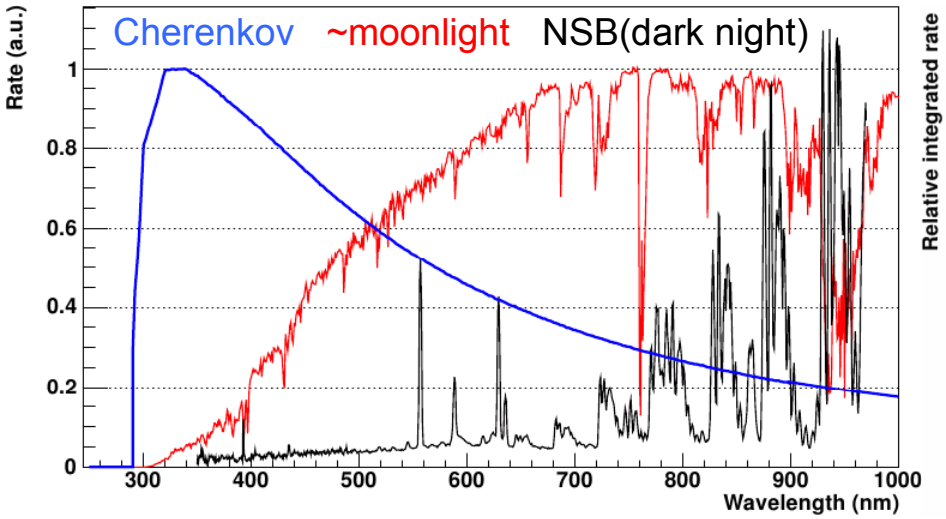


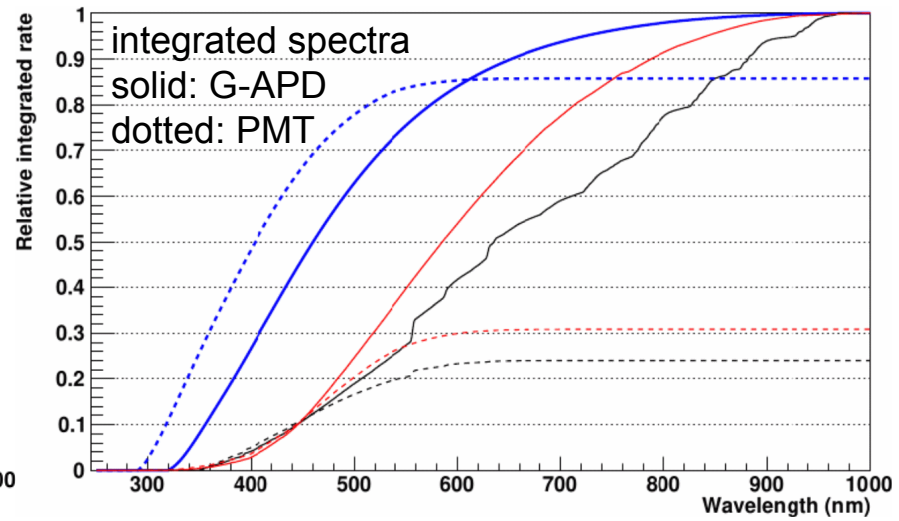
sensitivity curve of the first G-APDs not well adjusted to Cherenkov spect.

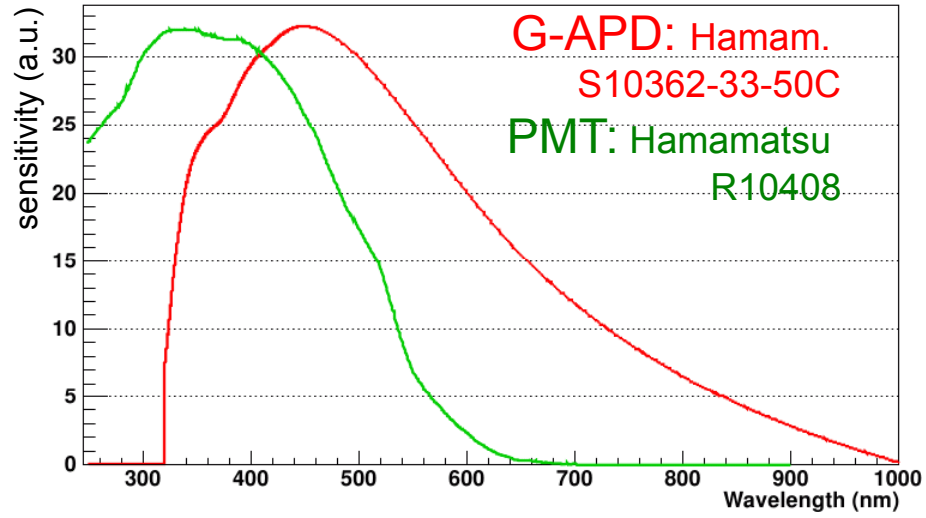
collect much more NSB (and moon) than optimized PMTs

Nevertheless, FACT can operate with lot of moonlight without aging

FACT – Signal & Background

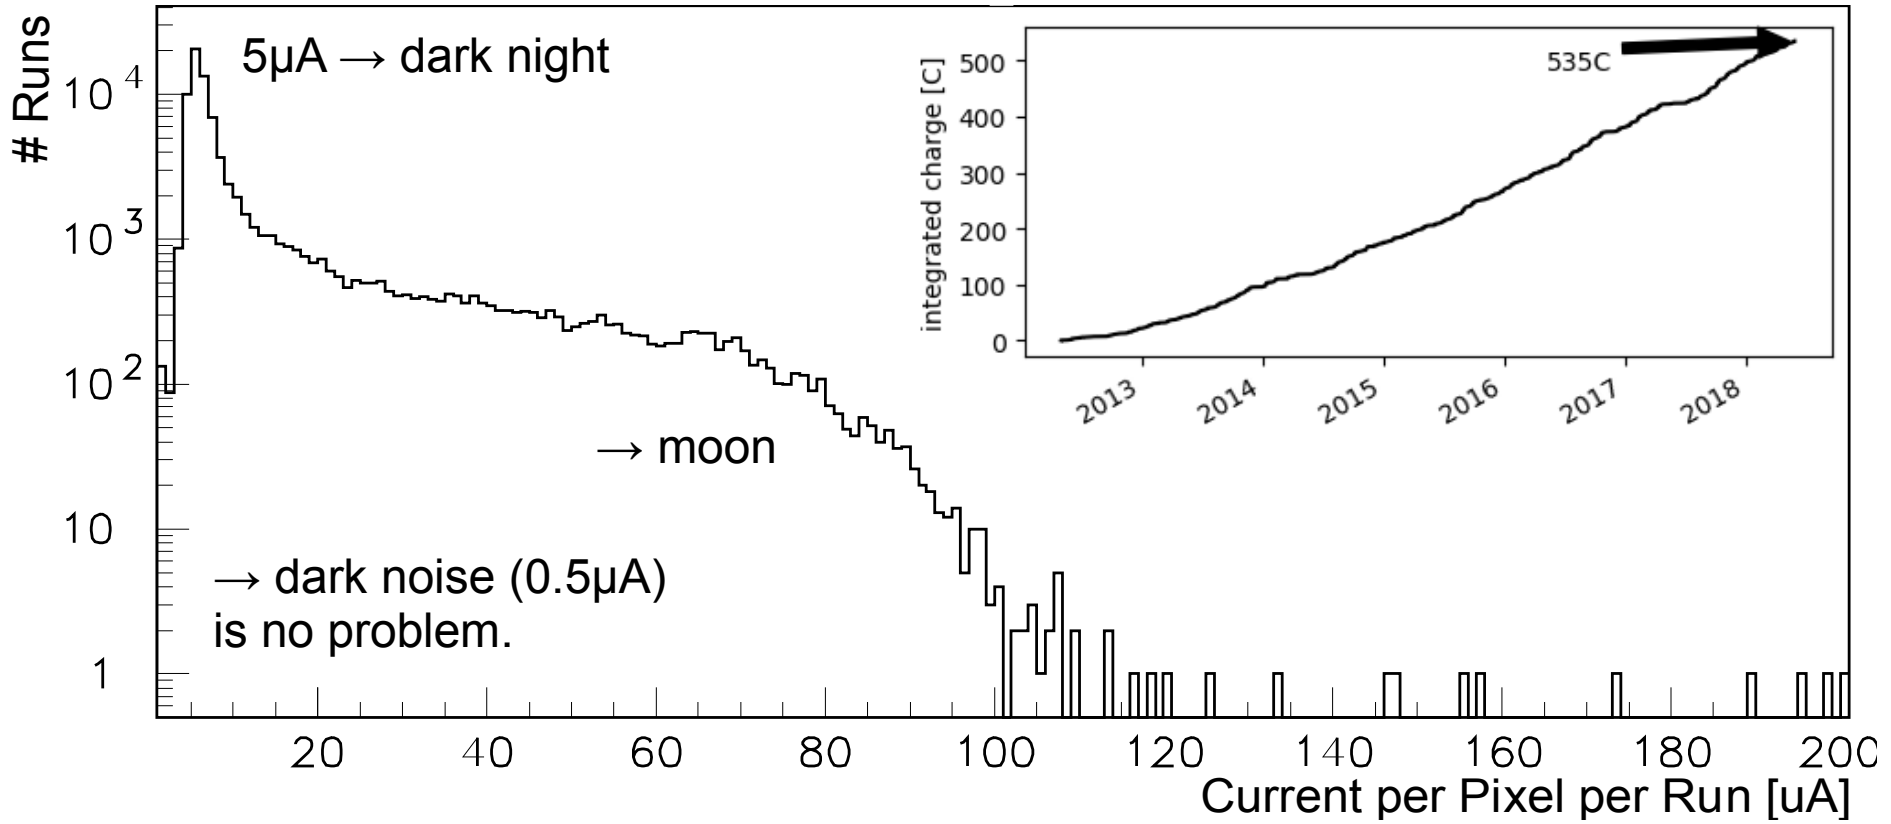






Today exist G-APDs, that are much better adapted to the needs of IACTs.

FACT – Collected Charge



integrating over time, divide by dark-night DC (5µA) for each sensor:

collected same charge as in ~30k hours dark night observations

dark noise: ~0.5µA (laboratory)

➔ **collected same charge as in ~34 years continuous op. in laboratory**

FACT – Automation

FACT – Automation

onsite data-taking (2011)

remote data-taking from anywhere (since late 2012)

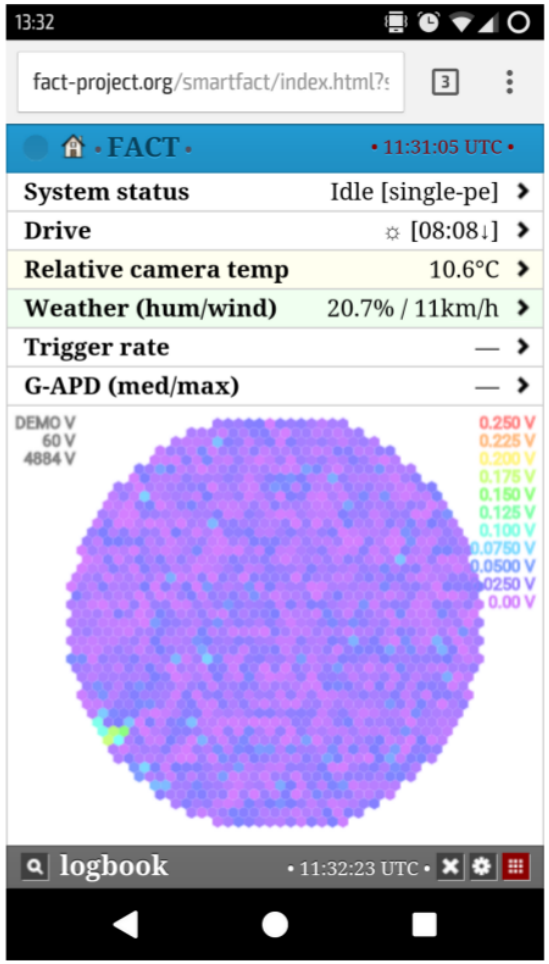
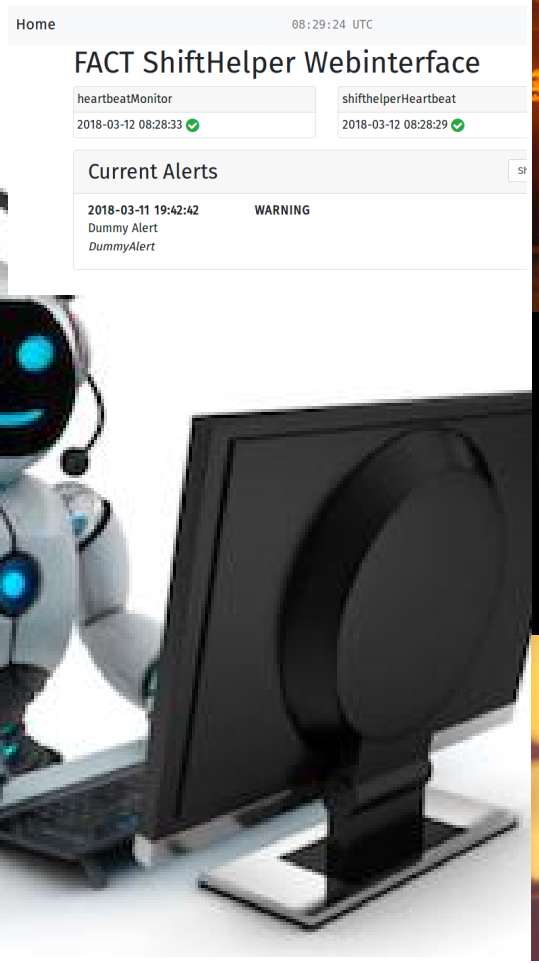
FACT – Automation





Evening: Arm System

Night: Sleep

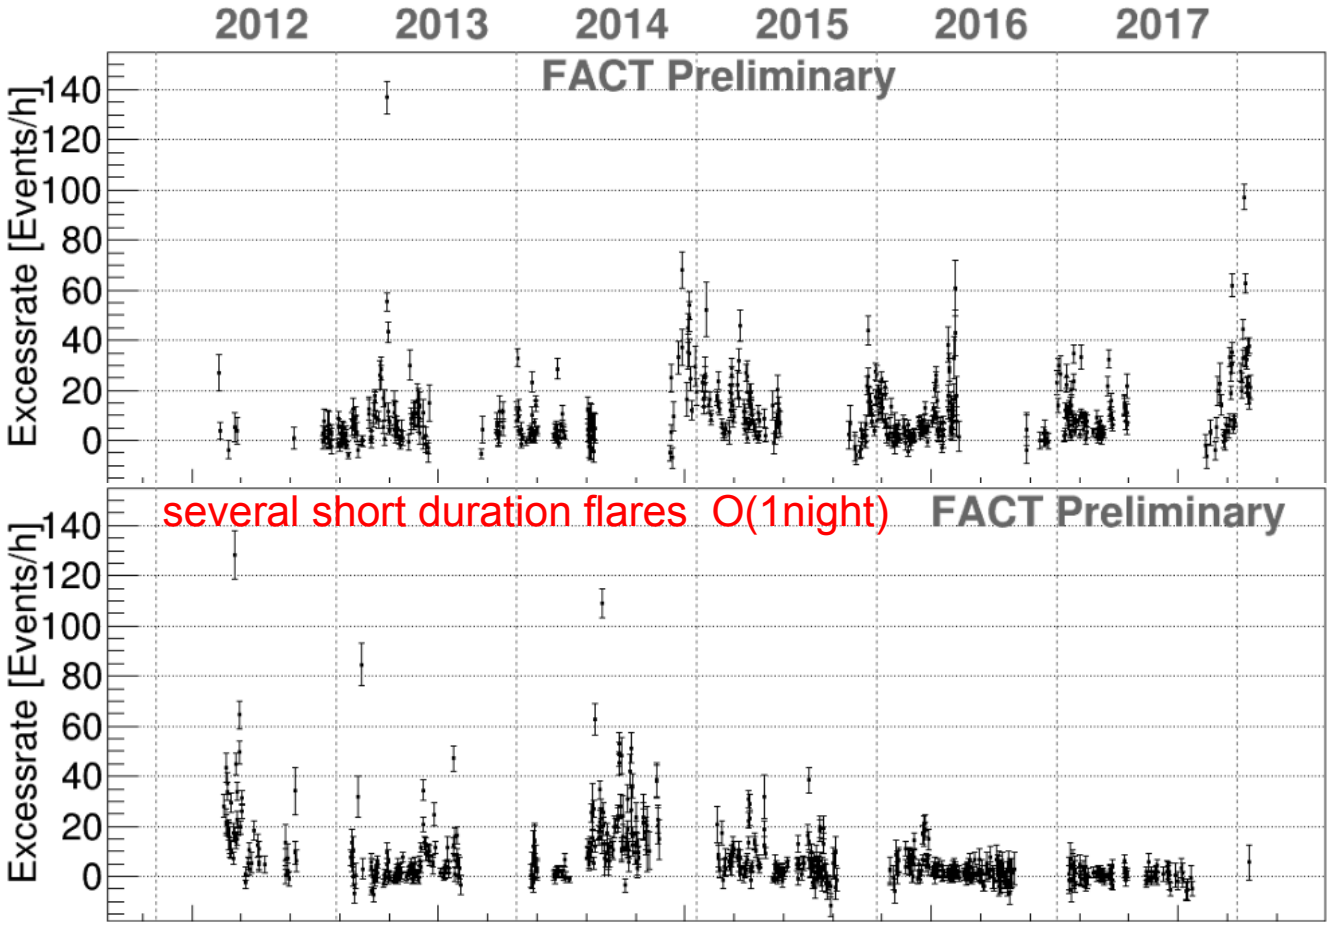
Morning: Parked?

Calls shifter if human interaction is needed

FACT – Science

FACT – Science

long-term monitoring of bright variable TeV sources and sending alerts:



Mrk 421

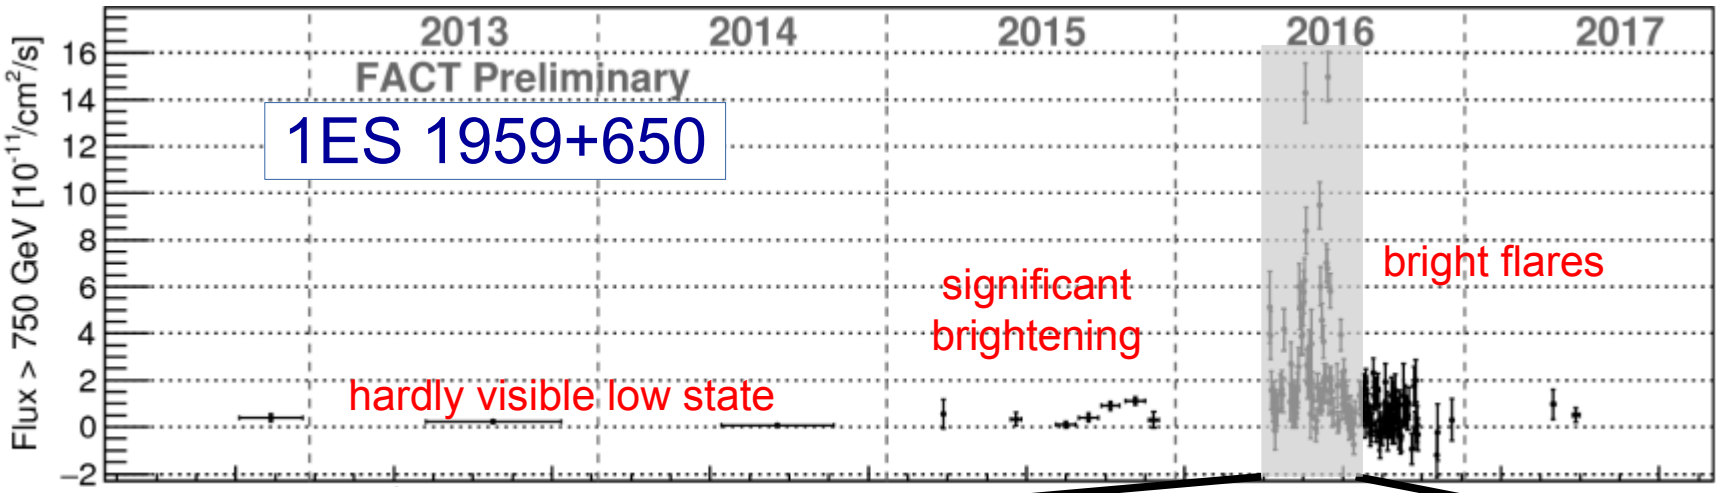
Mrk 501

(daily bining)

public access to QLA results: **http://fact-project.org/monitoring**

FACT – Science

long-term monitoring of bright variable TeV sources and sending alerts:



Flaring Activity 2016

FACT – Outlook

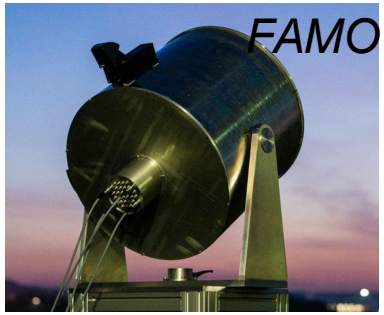
FACT – Impact

pre-FACT: all CTA designs based on (multianode) PMTs
[Exp.Astr. 32.3(2011)]

plus projects for future MST and LST cameras

post-FACT: many SiPM-based CTA projects.

And non CTA IACTs like:



Latest SiPM much better than those used in FACT
→ expect significantly better performances

FACT – Conclusion

- G-APDs are excellent sensors for IACTs

- temperature dependence can easily be corrected for

- (moderate) dark noise and crosstalk deliver an excellent calibration device for free (no need for lightpulsers etc.)

- stability allows to predict trigger rates; allows to measure quality of the atmosphere; ideal for long-term monitoring

FACT – Conclusion

- G-APDs are excellent sensors for IACTs

- temperature dependence can easily be corrected for

- (moderate) dark noise and crosstalk deliver an excellent calibration device for free (no need for lightpulsers etc.)

- stability allows to predict trigger rates; allows to measure quality of the atmosphere; ideal for long-term monitoring

We all know:

G-APD are not a 1-to-1 replacement of PMT
