

GSI-FAIR

The Universe in the Laboratory

CBM Collaboration Meeting, October 2018

Paolo Giubellino,
FAIR and GSI

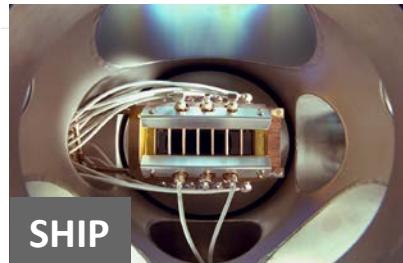

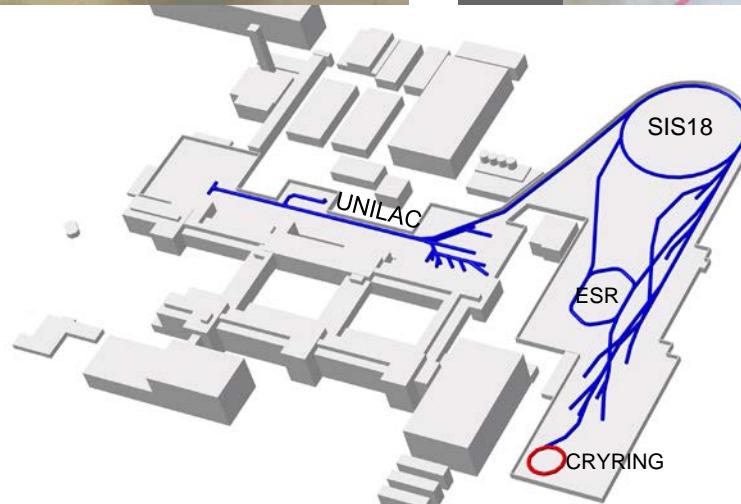

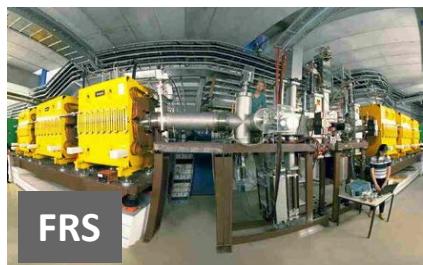

GSI – Almost 50 Years of Scientific and Technical Competence

- Existing accelerator facility has been upgraded to serve as injector for FAIR and – in the meantime – for FAIR phase 0

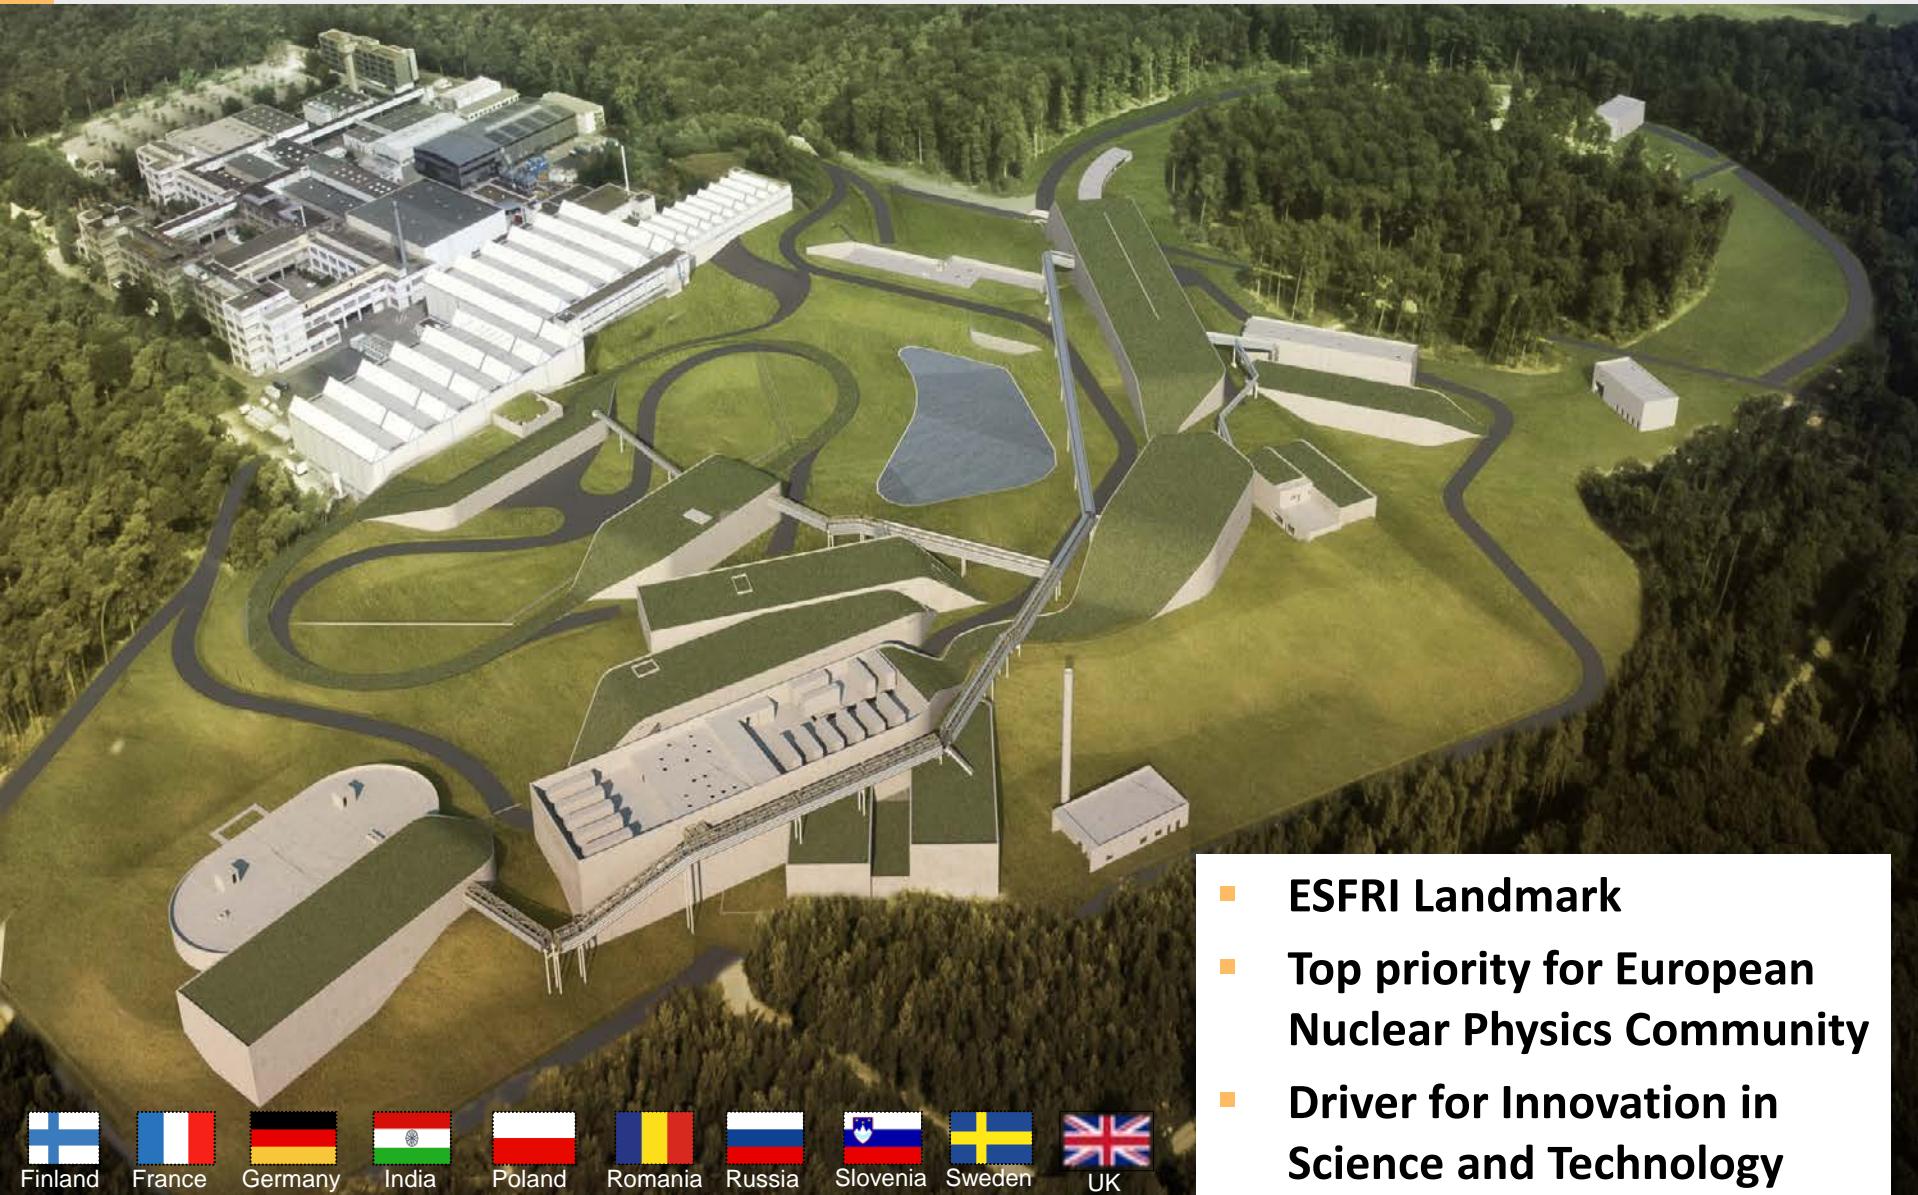

Research Infrastructures available at GSI

- open to external users, in particular from univ.

FAIR: Facility for Antiproton and Ion Research

– A World-Wide Unique Accelerator Facility

- **ESFRI Landmark**
- **Top priority for European Nuclear Physics Community**
- **Driver for Innovation in Science and Technology**

Finland

France

Germany

India

Poland

Romania

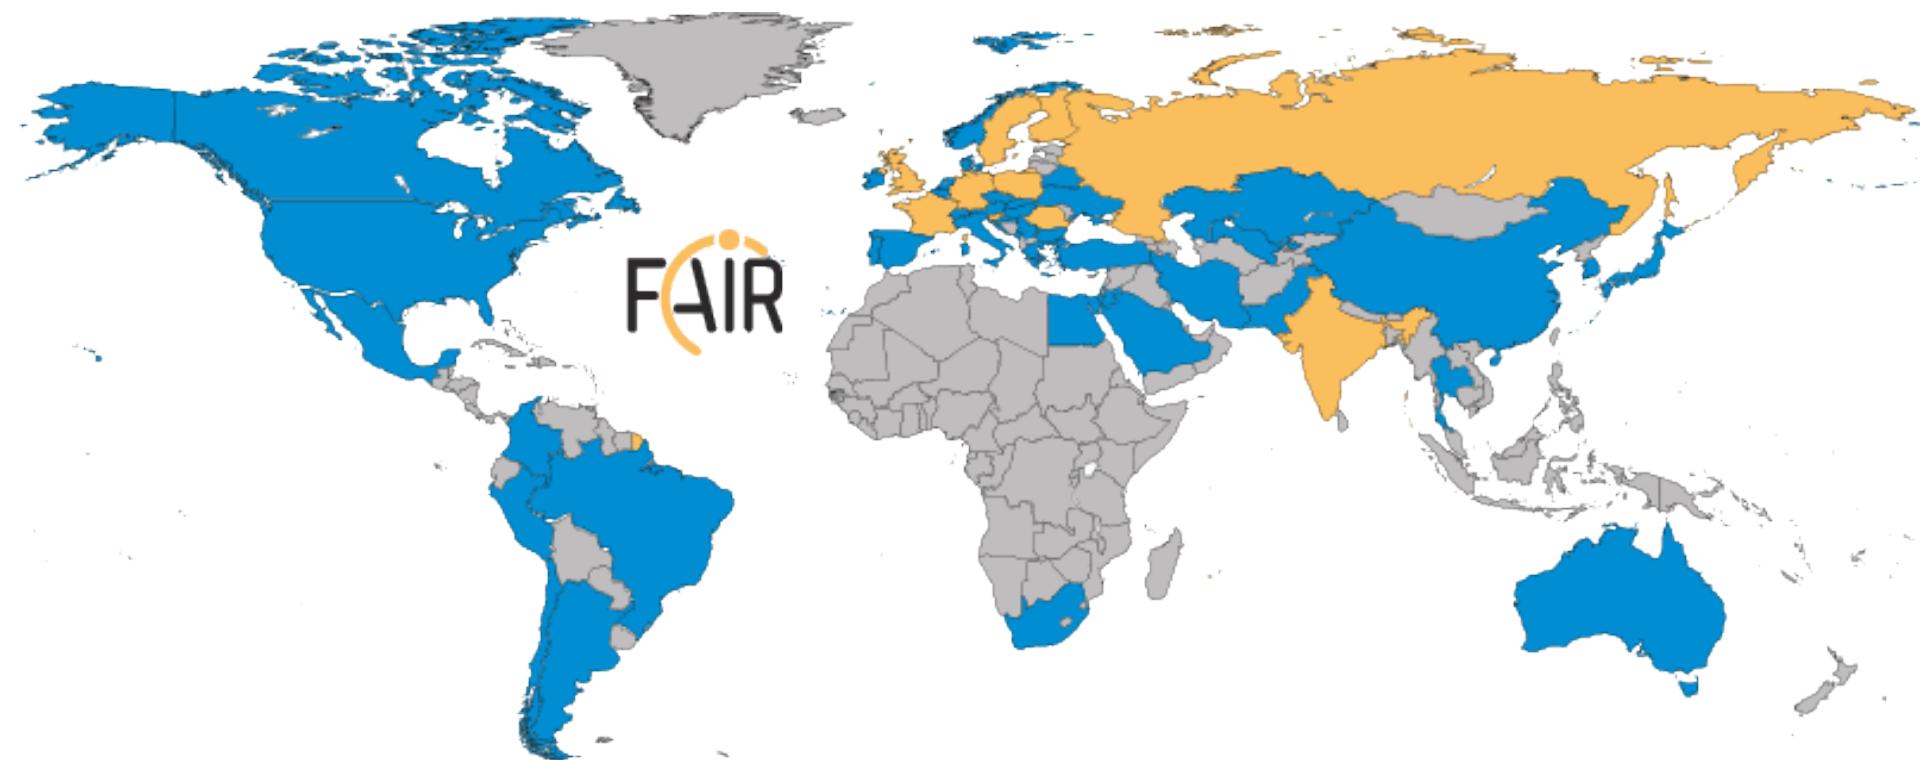

Russia

Slovenia

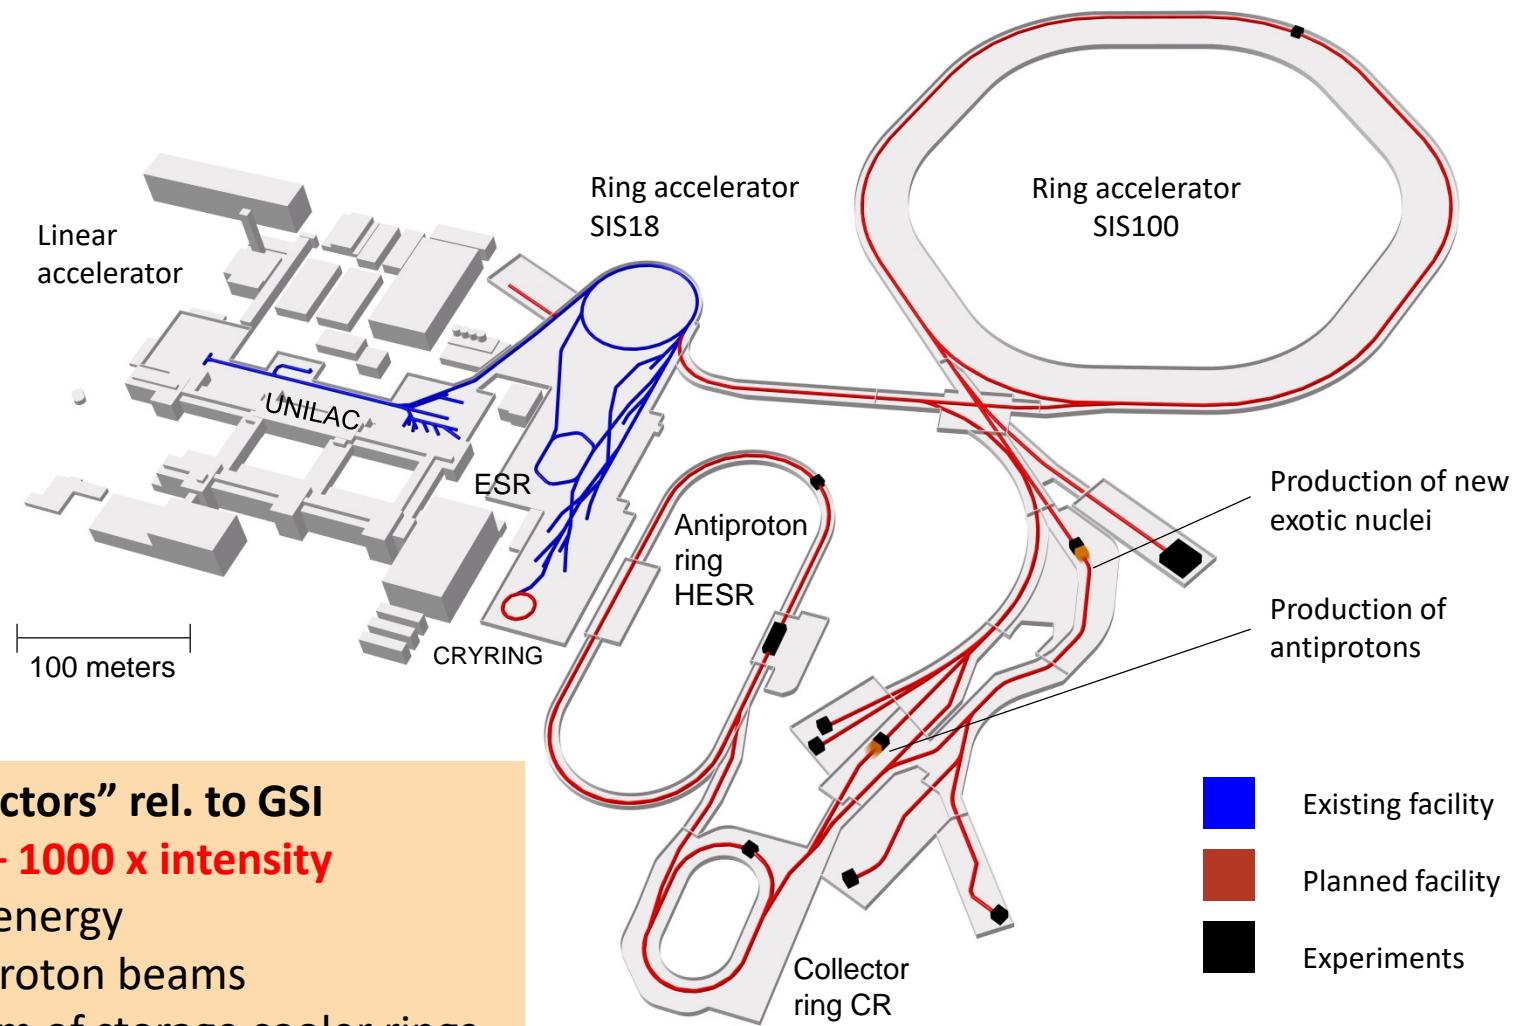

Sweden

UK

FAIR: International Cooperation

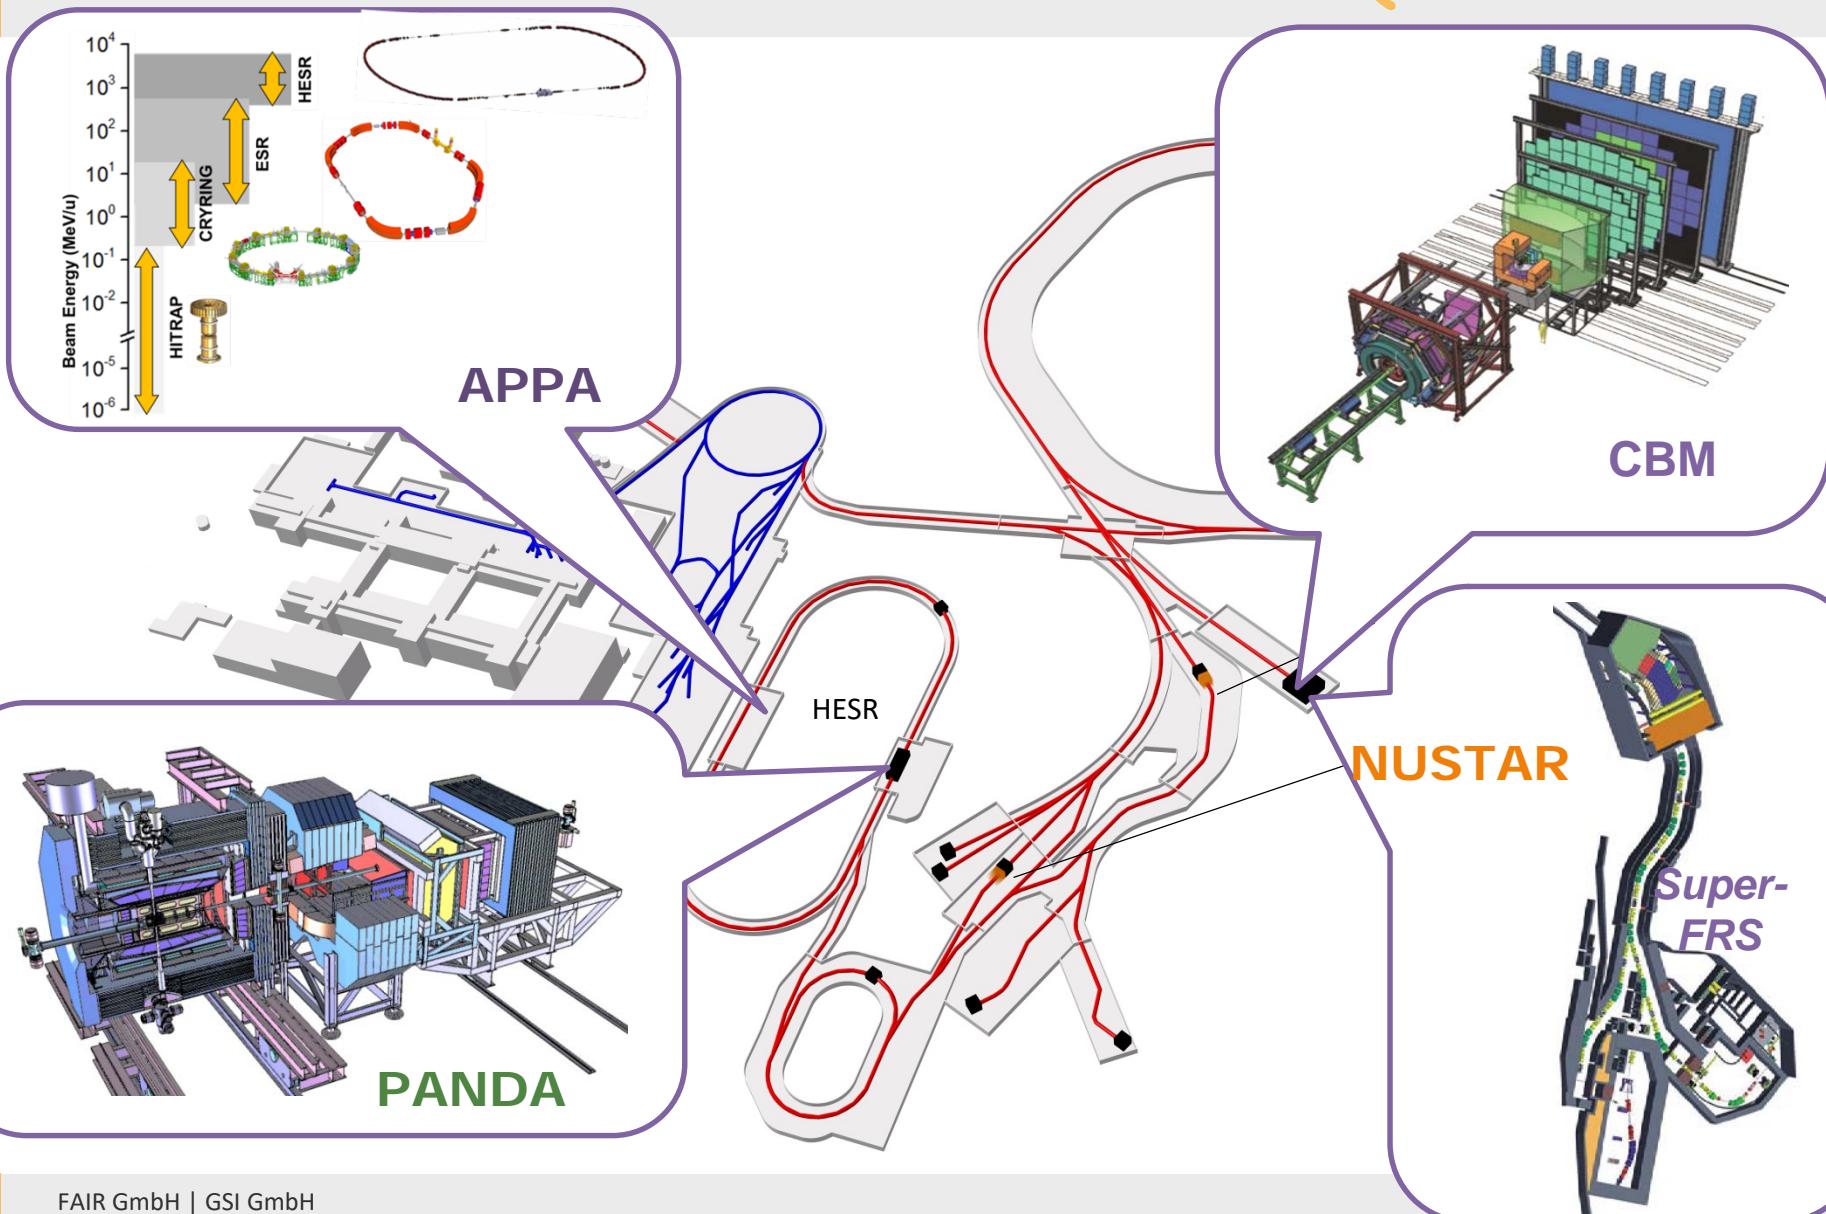

- Realization and operation of FAIR in **international cooperation**
- **Nine international FAIR shareholders**
- Participation of **3.000 scientists from all continents**

“Gain factors” rel. to GSI

- **100 – 1000 x intensity**
- 10 x energy
- antiproton beams
- system of storage cooler rings

FAIR – four research pillars

FAIR Research Pillars:

- a fore-front scientific program in many areas

APPA

- Atomic Physics and Fundamental Symmetries,
- Plasma Physics,
- Materials Research,
- Radiation Biology,
- Cancer Therapy with Ion Beams / Space Research

CBM

- Dense and Hot Nuclear Matter

NUSTAR

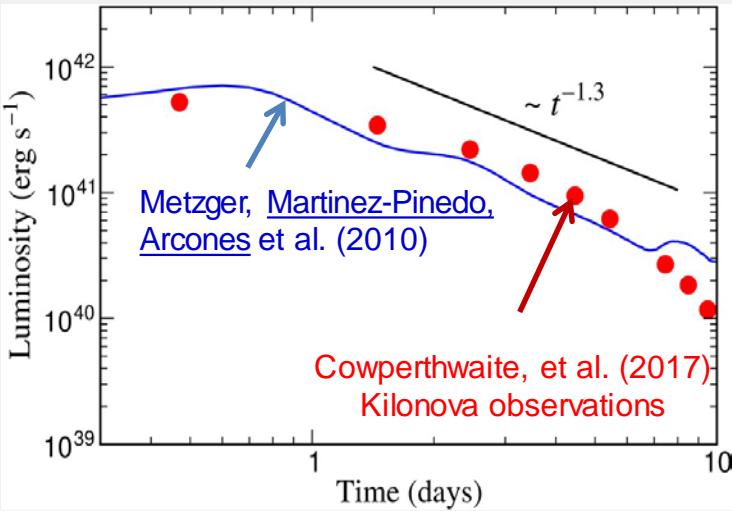

- Nuclear Structure and Reaction Studies
with nuclei far off stability,
- Physics of Explosive Nucleosynthesis (r-process)

PANDA

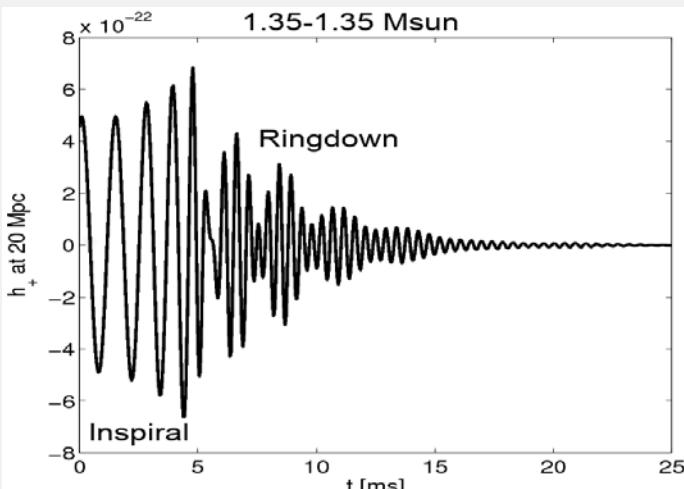

- Hadron Structure & Dynamics
with cooled antiproton beams

Further push of FAIR science motivation

... by multimessenger study of a neutron-star merger
last summer combined with theory & simulations

Electromagnetic “Kilonova” Signal

Gravitational Wave Signal

Theoretical prediction by GSI researchers (2010):

Neutron star mergers are the astrophysical site of the r-process producing the very heavy elements like Pt, Au and beyond, *thereby exhibiting a characteristic electromagnetic “Kilonova” signal.*

Confirmation by Ligo, Virgo and other astronomer groups (2017)

via detection of both *gravitational and electromagnetic waves emerging from such an event.*

FAIR was designed to study the properties of neutron star matter and to trace back the production paths of the heavy elements!

Neutron Star Mergers

FAIR Research Pillars

- Equation of State (**Hades, CBM**)
 - Gravitational wave signal
 - Amount of ejecta
- Baryon-Baryon interaction (**PANDA**)
- Exotic neutron-rich nuclei (**NUSTAR**)
 - r-process nucleosynthesis and abundances of the heaviest elements gold, platinum and beyond
- Plasma and atomic opacities (**APPA**)
 - Kilonova electromagnetic transient

The FAIR experiments offer unique opportunities for studying and solving these fundamental questions!

Status of FAIR: Civil Construction

rapid progress since official start on 4th of July 2017

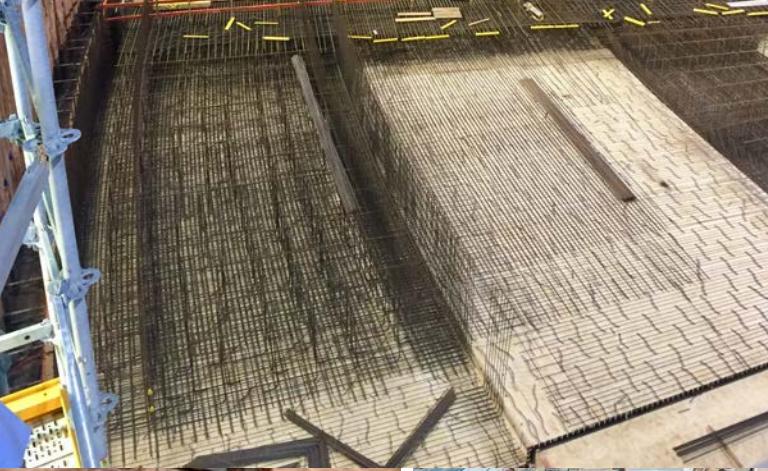

Excavation SIS100 tunnel

Completed ready for FAIR and FAIR phase 0

Excavation transfer building & CBM cave

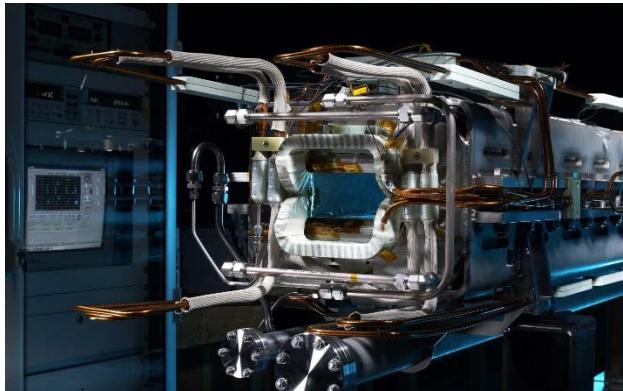

Start of concrete shell works for SIS100

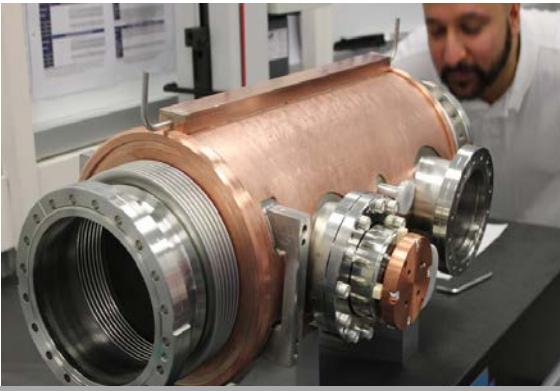

Status of FAIR: accelerators: construction / procurement progresses well

- Serial production for major components for SIS 100 is progressing with one quarter of the dipole magnets already manufactured.

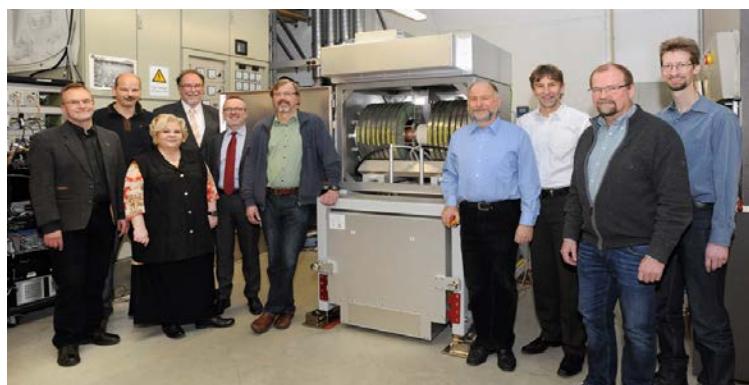

SIS100 Dipole Magnets

Cryo Catcher

Cryo-Bypass Line

Bunch Compressor

Quadrupole Unit

RF Cavity System

First of Series of SIS100 Quadrupole Magnets successfully cold-tested at JINR...

SIS100 quadrupole unit mounted
in the test cryostat (blue) at JINR,
Dubna

Cold-Test Facility
at JINR, Dubna

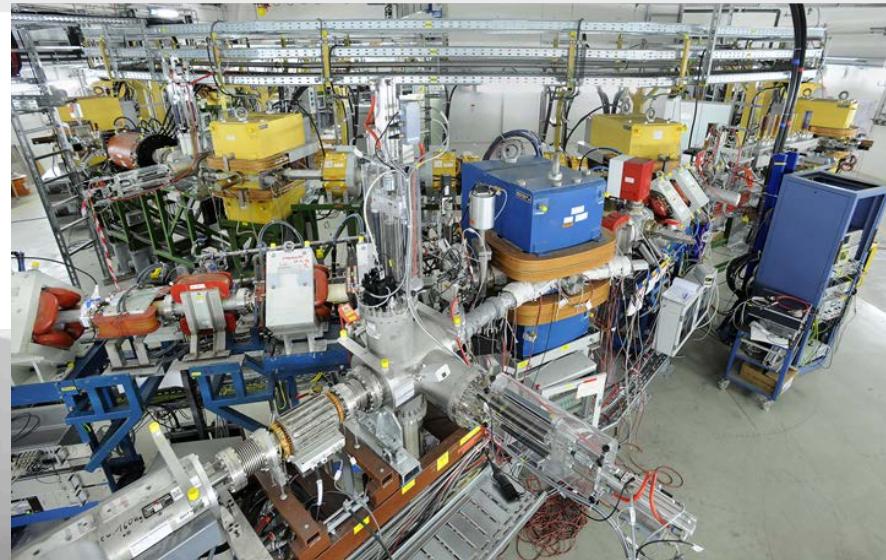

24 SIS100 (of 120) dipole magnets have been delivered and are being cold-tested ...

New CRYRING@GSI/FAIR

- ready for experiments and tests

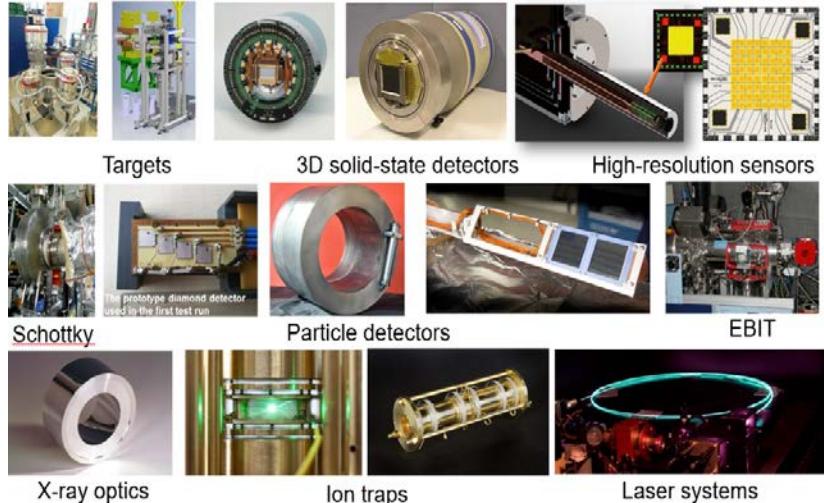

View from local injector to the ring

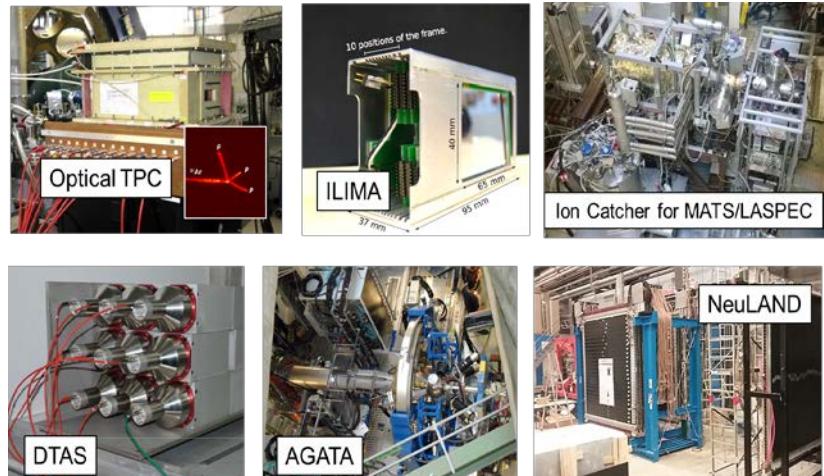

Status of FAIR: experiments

detector R&D and construction well on track ...

Schedule for Realizing FAIR

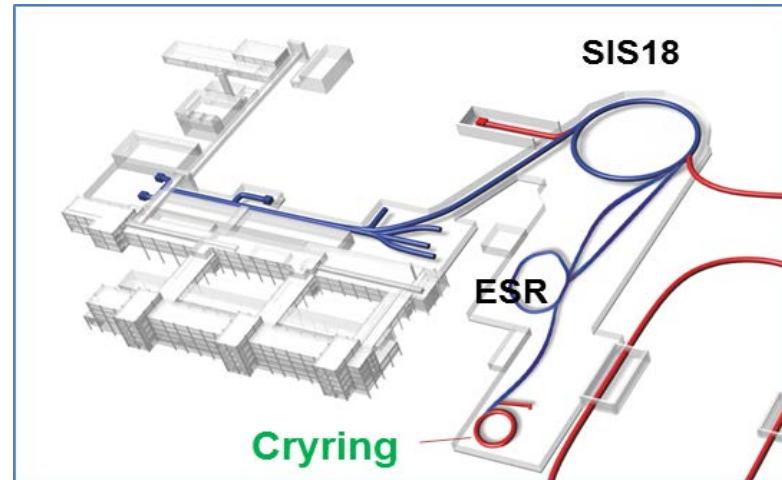

- Working towards the completion of FAIR by 2025
- ➡ Major thrust is on construction of FAIR accelerators and experiments
- ➡ But at the same time we pursue a staged approach to FAIR science and to the progressive commissioning of accelerators and detectors:
 - ***FAIR phase 0 : start in 2018/2019***
 - FAIR day 1/ phase 1 with FAIR accelerators progressively approaching design parameters
 - Full FAIR operation

FAIR Phase-0 intermediate research program

- Objectives:
 - Commissioning of accelerators and detectors
 - Forefront research by employing and testing new FAIR detectors
 - Exploiting upgraded GSI accelerator facilities incl. the **newly installed CRYRING**
 - Education of young scientists
 - Maintain and extend skills and expertise
 - Serve national and international user community

- requires careful techn. preparation:
 - **full re-commissioning of the UNILAC/SIS18/ESR complex incl. new controls**
 - gradual implementation

Scientific Steps towards implementing FAIR Phase-0

- Scientific programme and beam parameters defined, taking into account scientific and technical priorities of the FAIR Collaborations
- 110 days of beam time in 2018 planned, similar amount of beam time envisaged for 2019
- ‘Call for Proposals’ opened 2017
- **Nearly 150 submitted experiment proposals by well over 1000 scientists “overbook” available beam time by a factor of 2-3**
- High-profile international Program Advisory Committees, Overall PAC chaired by Prof. Sydney Galès evaluated proposals (G-PAC meeting held on 19.-21. Sept. 2017)

Evaluation of proposals for first FAIR Phase-0 Campaign 2018/19

Results G-PAC (overall): beamtime recommendations in 8 h-shifts

Session	Shifts requested			Shifts recommended (A)			Shifts extended (A and A-)

Shutdown 2016-2018

- brown: Civil Construction (GaF, Fire Protection, etc.)
- italic, red type: Process interferes with other work
- yellow: Accelerator maintenance and repair
- blue: Device tests
- green: Commissioning
- red: Beam Time

21.04.2017 Petra Schütt, Shutdown Koordination, eMail: shutdown@gsi.de

Beam time schedule foreseen for 2018

Accident: ER1 fire and RF ventilation contamination

- Fire in the ER1 transformer
- Power-off in the entire rf gallery
- Separation of the ER1 system
 - No single gap resonators
- Cleaning of all amplifiers AND all transformers
 - No rf operation until mid. Oct.

→ No more physics beam time
2018

Example: A3 transformer (weight about 3.6 t)

A3 transformer air box detail – contamination with metal pieces

images: B. Schlitt

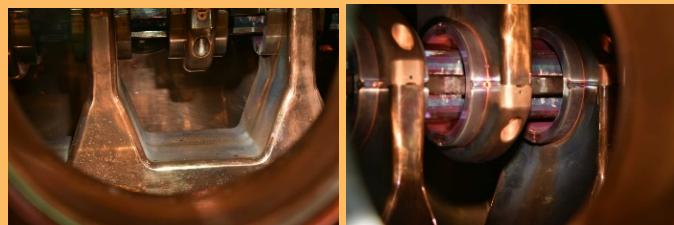

Main other challenges of the machine

RFQ

Limited amplitude causes limitation of m/q

⇒ **Very heavy ions: No high intensity yet**

images: P. Gerhard

New control system

FAIR control system not completed

⇒ **Complex operating**

⇒ **ESR not in operation**

⇒ **Still a lot commissioning needed**

⇒ **Limited parallel operation**

- Following the interruption of the physics run due to the accident and the resulting extended downtime, new plans had to be developed. After a careful analysis of the damage and the situation, the machine operation strategy is to shift the two data taking periods foreseen for fall 2018 and fall 2019 by a few months. They now will be performed in early 2019 and early 2020 respectively, and commissioning time has been added for the accelerators in order to address some of the technical issues in an optimised way.

New Plan: Goals and boundary conditions

- **Engineering run: Nov. 2018 – Dec. 2018**
 - Goal: to establish basic operation conditions that are required for the Physics program in 2019
 - boundary conditions:
 - limited capabilities of new FAIR controls
 - Not yet comprehensive tools including up to date lattice layouts for beamline tuning
 - no storage mode capabilities available for comprehensive ESR commissioning
- **Physics run: March 2019 – April 2019**
 - Goal: to provide reliable operation for the scheduled Physics programs
 - boundary conditions
 - limited choice of heavy ions due to HSI RFQ technical limitation
 - No single gap resonators at the end of post stiper
 - No parallel operation in planning to ensure reliability
- **Engineering run: Nov. 2019 – Dec. 2019**
 - Goal: 1) to establish ESR storage mode 2) to establish deceleration in ESR 3) to complete the comissioning of CRYRING with ESR beam
 - newly introduced FAIR controls for ESR must allow storage mode
 - Expect to be available for commissioning no earlier than Sept. 2019

General Plan of Accelerator Operations 2018 (approved: 2018-09-12)

Main focus of the engineering run

- establish slow extraction beam to HADES
- start ESR commission controls
- FRS commissioning, mCBM detector setup

General Plan of Accelerator Operations 2019 (approved: 2018-09-20)

Engineering Run

Information

Planned shutdown major activities

- UNILAC HSI RFQ new electrodes
 - in progress. Expect installation ~mid 2019
- UNILAC UHV upgrade: full scale: **8 month**
- TGA fire protection renovation

FAIR 2025

Thank You!
