Thermodynamics of IRFP* and Technicolor theories from gauge/gravity duality

Janne Alanen

with

Kajantie arXiv:0912.4128 and Kajantie,Tuominen work in progress

Heidelberg, 18.03.2010

*Infrared fixed point

Table of contents

1. Motivation

2. Gauge/gravity duality

3. IRFP

4. Technicolor

5. Conclusions

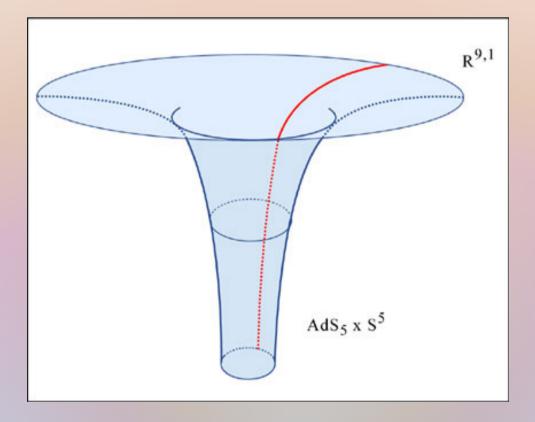

1. Motivation

- Study thermodynamics of field theories which have a strong coupling regime: QCD, IRFP, Technicolor...
- Strong coupling \rightarrow perturbation theory does not work
- Methods: Lattice, gauge/gravity duality...

Aim of this talk

Introduce the 5D Einstein-Dilaton model and use it to calculate thermodynamics for various field theories.

2. Gauge/Gravity duality

Gauge/gravity duality or Holography

- Idea: pure gauge theory is dual to higher dimensional theory including gravity
- First realization by Maldacena, -97:

- String theory on AdS₅ x S₅ dual to d=4 SU(N) N=4 supersymmetric theory

• 't Hooft limit

Gravity

$$\lambda = g^2 N_c o \infty, \; N_c o \infty$$

Classical gravity

Strongly coupled quantum theory

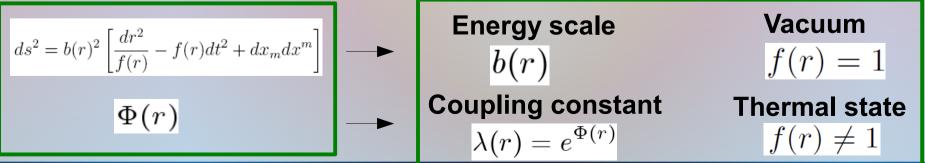

IHQCD: Improved Holographic QCD/SU(N). Gursoy, Kiritsis, Mazzanti, Nitti...

- Pure gravity in AdS is dual to a <u>strongly coupled conformal</u> field theory but realistic field theories have also a <u>weak</u> <u>coupling regime</u> and are <u>non-conformal</u>.
- In IHQCD these two aspects are introduced by extra scalar field

$$S = \frac{1}{16\pi G_5} \int d^5 x \sqrt{-g} \left(R - \frac{12}{\mathcal{L}^2} \right) \longrightarrow S = \frac{1}{16\pi G_5} \int d^5 x \sqrt{-g} \left(R - \frac{4}{3} (\partial \Phi)^2 - V(\Phi) \right)$$

Arbitrary. Contains AdS constant

• Ansatz and identifications

Equations/Potential fixing

- By the choice of the coupling constant and energy scale we have fixed the scheme we are working in
- Beta function:

$$\frac{d\lambda}{d\ln E} = \frac{d\lambda}{d\ln b} = \beta(\lambda)$$

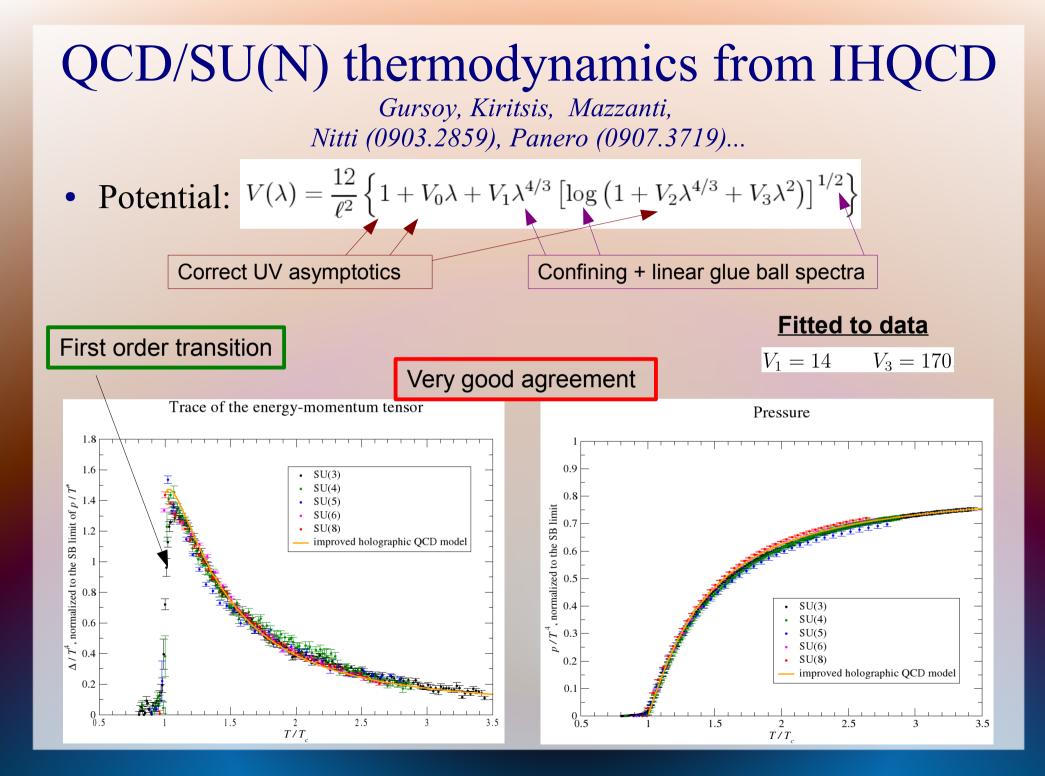

• Einstein equations:

$$6rac{b'^2}{b^2} - 3rac{b''}{b} = rac{4}{3}rac{\lambda'^2}{\lambda^2}$$

Dilaton potential is chosen so that it produces expected dynamics for dual theory.

 $\frac{f''}{f'} + 3\frac{b'}{b} = 0 \qquad 6\frac{b'^2}{h^2} + 3\frac{b''}{h} + 3\frac{b'}{h}\frac{f'}{f} = \frac{b^2}{f}V(\lambda)$

For example: QCD must be asymptotically free at UV and confining at IR

3. Theories with Infrared Fixed Point

Banks-Zaks

• Definition:

$$\beta(\lambda_{fp}) = 0$$

-Scheme independent: $\lambda(\lambda_{fp}^{\star}) = \lambda_{fp}$

$$\frac{d\lambda}{d\ln E} = \beta(\lambda) \implies \beta^{\star}(\lambda^{\star}) = \left(\frac{d\lambda(\lambda^{\star})}{d\lambda^{\star}}\right)^{-1} \beta(\lambda(\lambda^{\star}))$$

Beta function slope still depends on scheme!

Perturbative $FP \rightarrow$ in the weak coupling regime

QCD with large number of flavors: Banks-Zaks('82)
 fixed point

$$eta(\lambda) = -b_0(N_c,N_f)\lambda^2 - b_1(N_c,N_f)\lambda^3$$

$$\lambda_{fp} = -rac{b_1(N_c, N_f)}{b_0(N_c, N_f)} > 0$$

 $N_c = 3, N_f \ge 9$

$$-0.0001 \begin{bmatrix} N_c = 3 \\ N_f = 15 \end{bmatrix} \lambda$$

Non-pertubative fixed point

- In supersymmetric QCD the beta function can be calculated exactly. *Novikov-Shifman-Vainshtein-Zakharov*
- There has been a proposal for the exact beta function for non-supersymmetric theories. *Ryttov, Sannino...*

Generally these take a form

$$eta(\lambda) = -2eta_0\lambda^2rac{(1-v\lambda)}{1-j\lambda}$$

• Search for theories with IRFP is a hot topic in lattice field theory. *Catterall-Giedt-Sannino-Schneible* 0807.0792, *Hietanen-Rummukainen-Tuominen* 0904.0864, *Del Debbio-Lucini-Patella-Pica-Rago* 0907.3896

WARNING!

- Fermions are crucial for IRFP and TC theories
- Adding effects of the flavor to gauge/gravity duality is non-trivial.*Karch, Katz, Erdmenger, Meyer, O'Bannon, Ammon, Kiritsis, Kerner*
- We assume that 5D Einstein-Dilaton model can be used also with theories where flavor is important and that flavor affects only the form of the dilaton potential

$$V(\lambda) \longrightarrow$$
 QCD, infrared
fixed point,
Technicolor

Note

- For IRFP and TC duals the <u>underlying field theory</u> is <u>unspecified</u> and thermodynamic properties are calculated using the <u>dilaton potential</u> which produces typical beta functions.
- Dilaton potential contains <u>free parameters</u> which have to be restricted by the choice of underlying theory

Holographic IRFP: thermodynamics

Alanen, Kajantie, Tuominen...

• Calculate dilaton potential from a given beta function

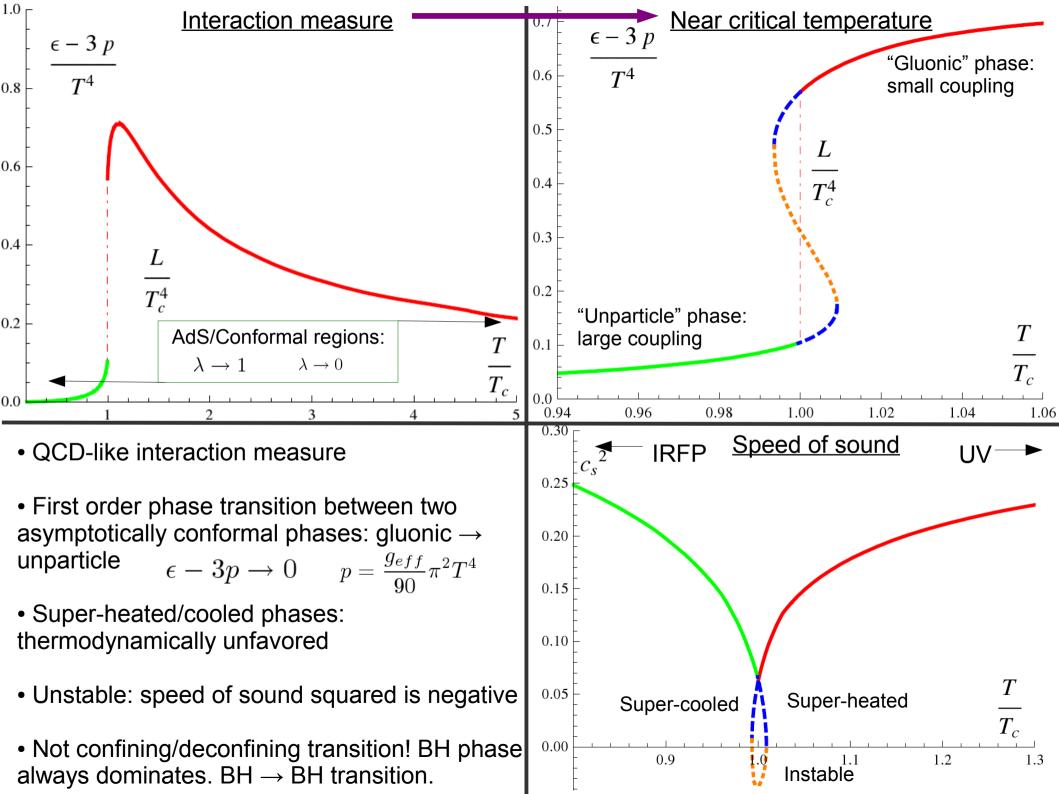

Can be calculated exactly

$$\beta(\lambda) = -c\lambda^{2} \frac{(1-\lambda)^{2}}{1+a\lambda^{3}} \qquad f(r) = 1$$

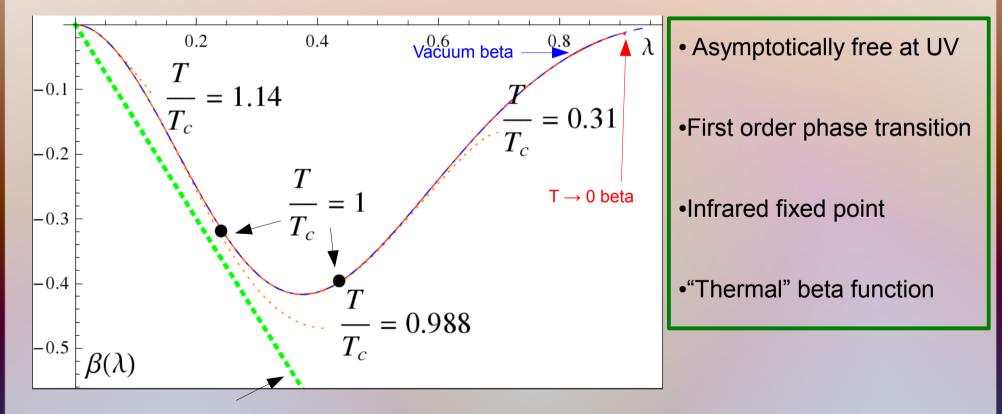

$$V(\lambda) = \frac{12}{\mathcal{L}^{2}} e^{-\frac{8}{9}\int d\lambda \frac{\beta(\lambda)}{\lambda^{2}}} \left[1 - \left(\frac{\beta(\lambda)}{3\lambda}\right)^{2}\right]$$

$$V(\lambda) = \frac{12}{\mathcal{L}^{2}} e^{-\frac{8}{9}\int d\lambda \frac{\beta(\lambda)}{\lambda^{2}}} \left[1 - \left(\frac{\beta(\lambda)}{3\lambda}\right)^{2}\right]$$

• Search black hole solutions with $f(r) \neq 1 \rightarrow \mathbf{Thermodynamics}$

Beta function

"confining line"

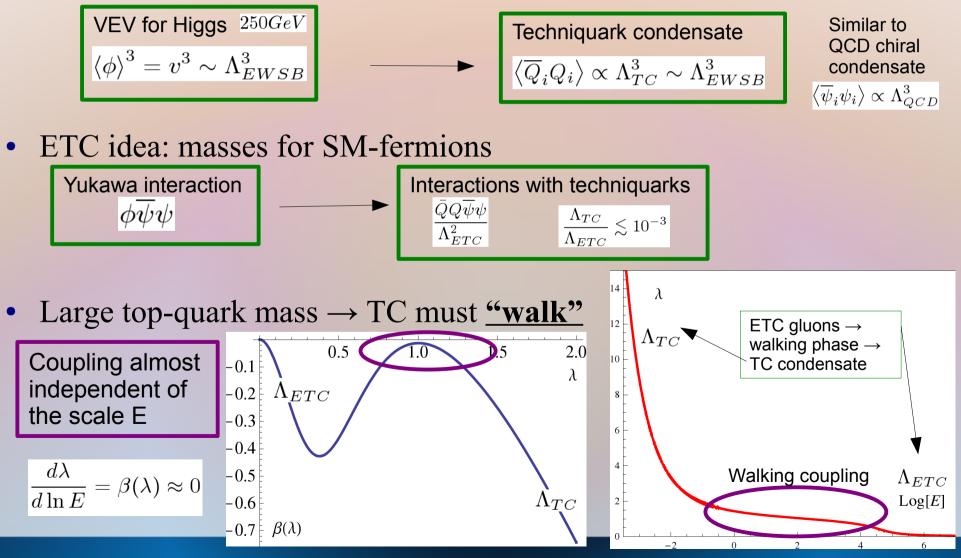

$$eta(\lambda)=-rac{3}{2}\lambda$$

4. Walking Technicolor

Walking Technicolor

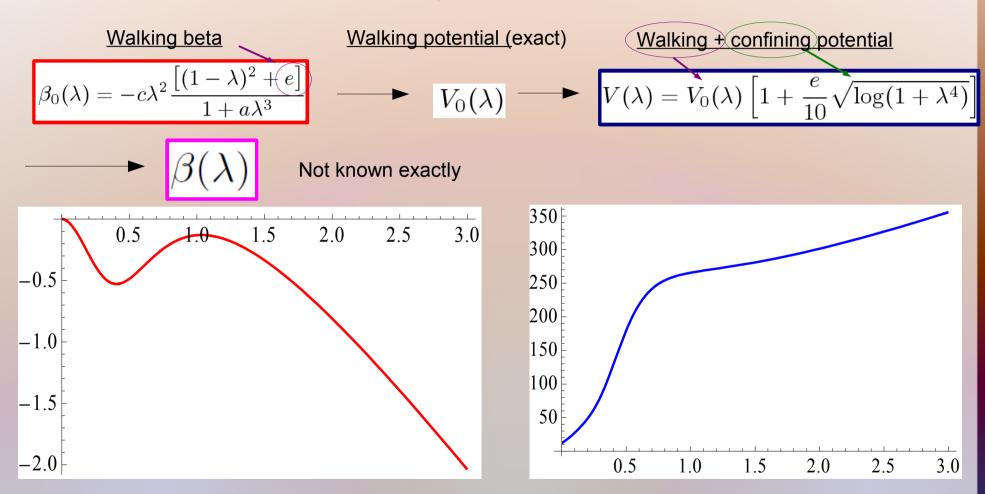

Weinberg, Susskind, Eichten, Lane,Sannino...

• TC idea: add new <u>strongly coupled theory</u> to EW scale which produces masses for weakly interacting bosons by chiral condensate

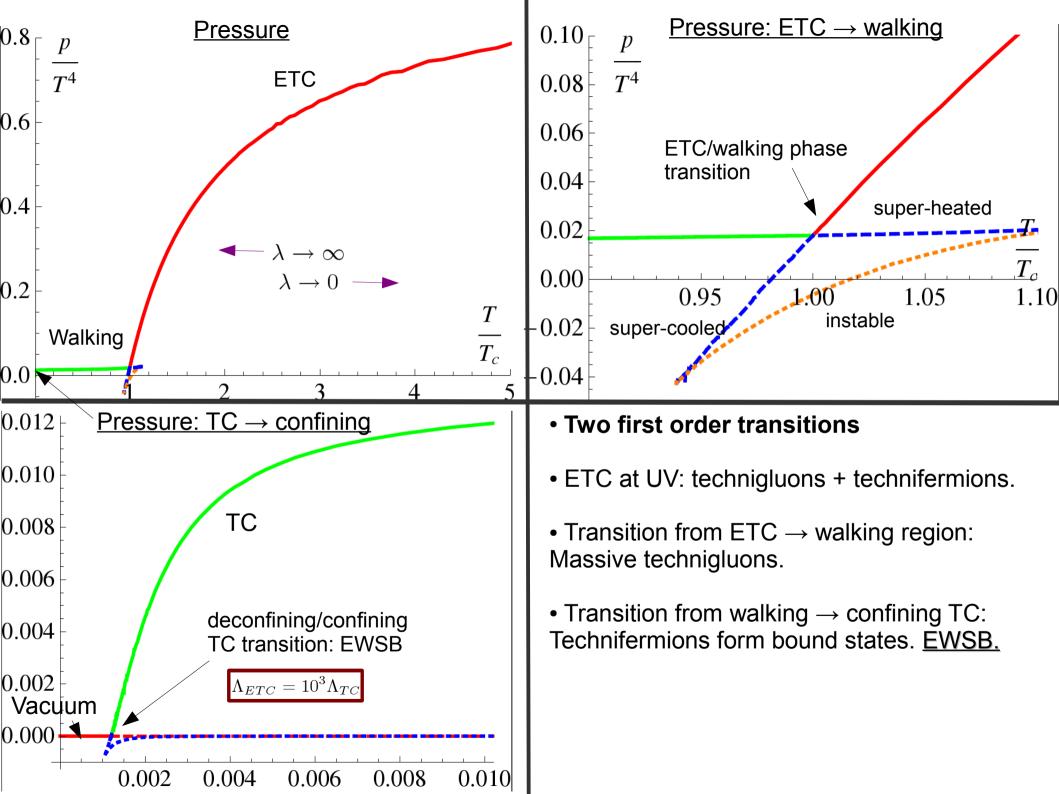

Holographic Walking TC: thermodynamics

Alanen, Kajantie, Tuominen...

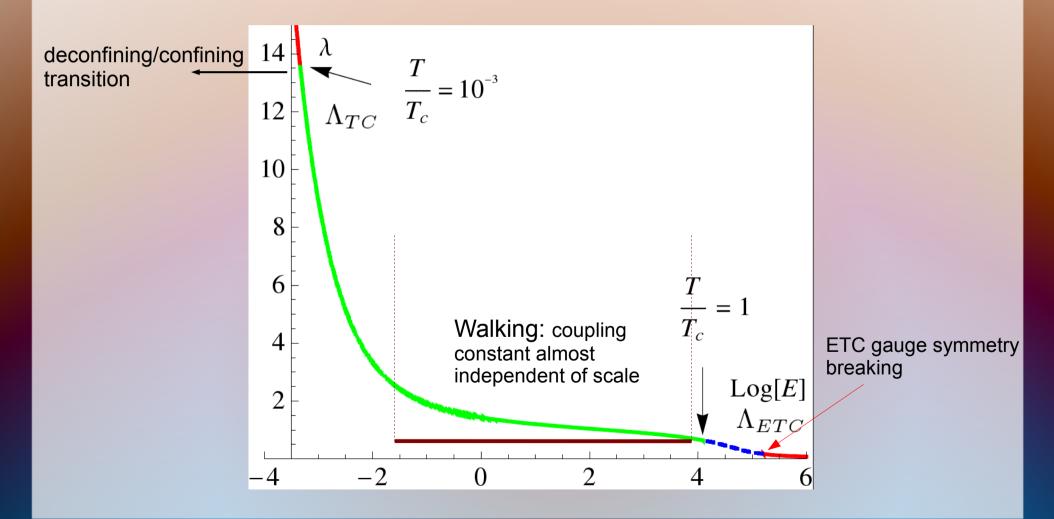

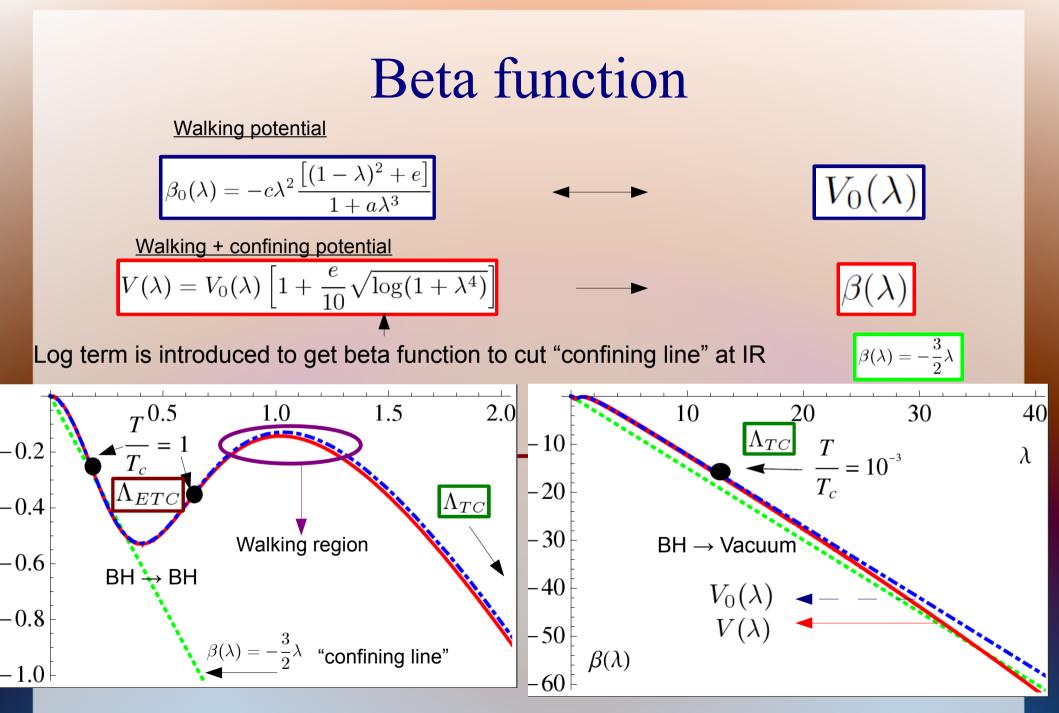

•Search black hole solutions with $f(r) \neq 1 \rightarrow$ **Thermodynamics**

Coupling/Energy

This dilaton potential really produces walking behavior for the coupling

5. Conclusions

- We have presented a scheme for converting a beta function of a gauge theory to its thermodynamics via gauge/gravity duality
- The scheme is a phenomenological bottom-up one; real effect of the fermions?
- Many further topics for study:
 - Scanning over parameters, different betas/potentials, case of several couplings, transport coefficients, mass spectra...
